

Evaluation of Ensemble Icing Probability Forecasts in NCEP's SREF, VSREF and NARRE-TL Systems

**Binbin Zhou^{1,2}, Jun Du², Geoff DeMigo²
and Robert Sallee³**

- 1. I.M. System Group**
- 2. Environmental Modeling Center of NCEP**
- 3. Wyle Info Systems & Aviation Weather Center of NCEP**

15th Conference on ARAM, Aug 1-4, 2011, Los Angeles, CA

NCEP SREF/VSREF/NARRE-TL ICING products

Existed for a while but never been verified objectively

Different from AWC-FIP, SREF/VSREF/NARRE-TL's icing probability product is based on a simple diagnosis when:

T, RH and vertical velocity fall in certain ranges (suggested by AWC)

SREF Icing ensemble probability (6Eta, 5 NMM, 5ARW, 5 RSM):

Computed from 21 equal-weighted SREF members, 32 km res

VSREF/NARRE-TL Icing ensemble probability (6 previous RUC/RR, 4 previous NAM):

VSREF: Computed from 10 unequal-weighted VSREF members including 6 RUC and 4 NAM time-lagged runs, 13km resolution

NARRE-TL

Time Lagged N. America Rapid Refresh Ensemble System

Similar to VSREF but with 6 RR and 4 NAM time-lagged runs

RR: WRF ARW + GSI with larger domain + Alaska

After Nov 0f 2011, RUC/VSREF will be stopped

ADDS (Aviation Digital Data Service, by AWC & NCAR)

Analysis data, including CIP, FIP and others (GTG, V&C, etc ...)

CIP – Current Icing Potential (Obsv + RUC analysis)

FIP – Forecast Icing Potential (by RUC analysis)

Generated at AWC, GRIB data transferred to NCEP/EMC

ADDS/CIP

Combination of satellite data, radar, METAR, pilot report, Lightning data and RUC to generate a 3-D diagnosis of icing potential, super-cooled liquid water droplet (SLD) and icing severity.

Choose CIP severity as icing truth

CIP Severity: 0, 1, 2, 3, and 4

0 – no icing, 1 – trace, 2 – light, 3 – moderate , 4 – severe.

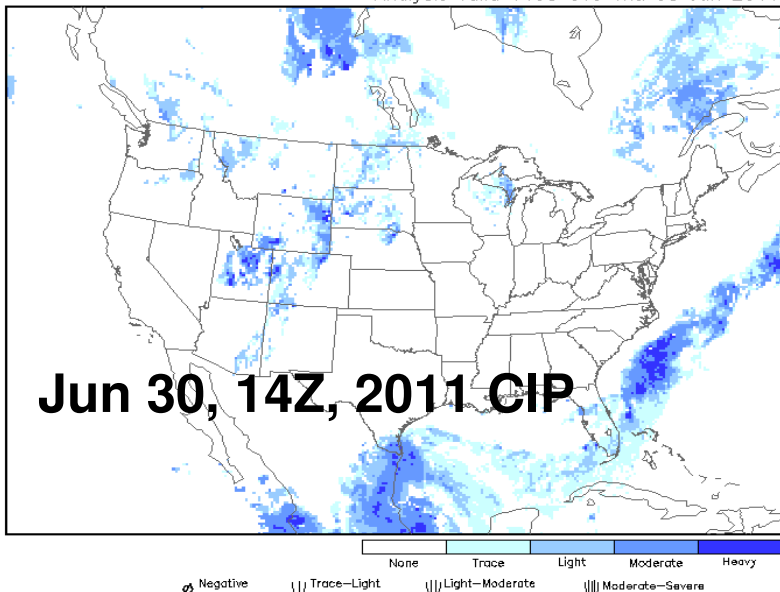

Example: SREF, VSREF, NARRE-TL icing Prob: Compared to ADDS-CIP severity

By FAA policy CIP is a Supplementary Weather Product for enhanced situational awareness only and must be used with one or more primary products (safety decision) such as an AIRMET or SIGMET (see AIM 7-1-3).

Icing severity at FL190

Analysis valid 1400 UTC Thu 30 Jun 2011

SREF: Probability of icing at FL180 06H FCST from 09z Jun 30 2011. Verified Time: 15z 06/30/2011

VSREF: Probability of Icing at FL180 06H FCST from 08z Jun 30 2011. Verified Time: 14z 06/30/2011

NARRE: Probability of Icing at FL180 06H FCST from 08z Jun 30 2011. Verified Time: 14z 06/30/2011

Verification Method

Prob-Event (P-E) grid-to-grid verification

Icing “Probability $\geq Pt$ ” against Icing “Event (severity ≥ 1)”
where Pt is a series of ensemble prob thresholds: 10, 20, ...90%

1. Deterministic: FHO (Fcst – Hit -- Obsv, under a prob thresholds Pt)

Fcst: Prob $\geq Pt \leftrightarrow$ Obsv: CIP ≥ 1

Hit: Prob $\geq Pt \ \&\& \ CIP \geq 1$

False alarm: Prob $\geq Pt \ \&\& \ CIP < 1$

Miss: Prob $< Pt \ \&\& \ CIP \geq 1$

Then compute POD, FAR, Bias, ETS, traditional scores

Repeat with different Pt (10%, ... 50%, ... 90 %)

2. Probabilistic: Use PBS (Probabilistic Brier Score) to compute reliability within 10 probability bins

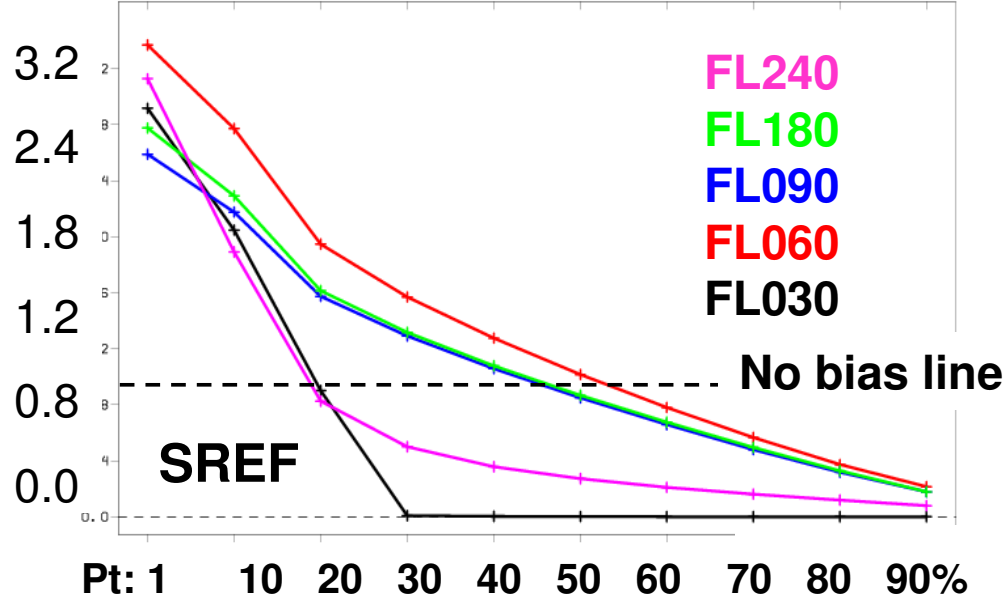

Verification time: 60 days from April 28 ~ June 28, 2011

ETS (Equitable threat score)

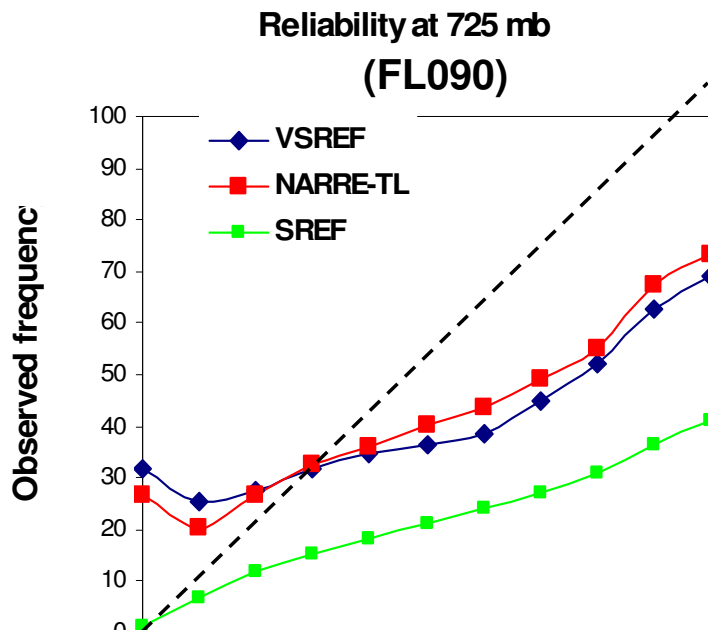

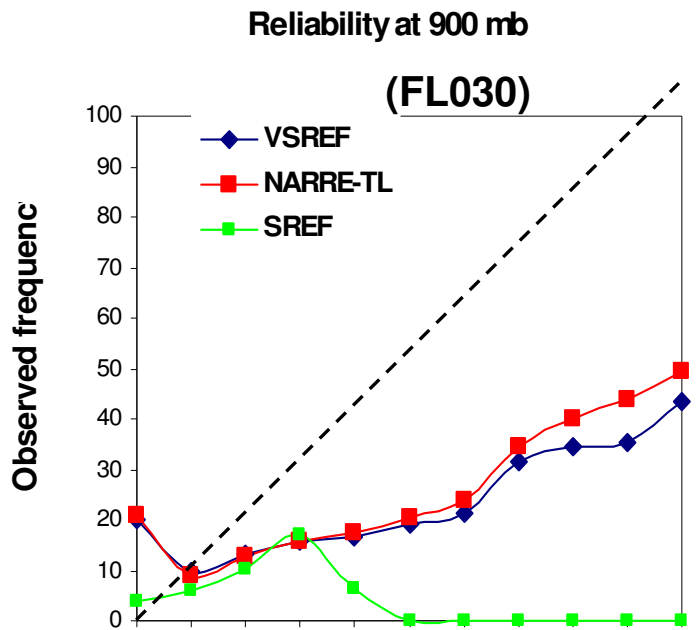

NARRE-TL and VSREF better than SREF

Very high levels: worse

Very low levels: worse (SREF)

Decrease with prob thresholds

~ ETS of Precip but < FIP (0.3~0.5)

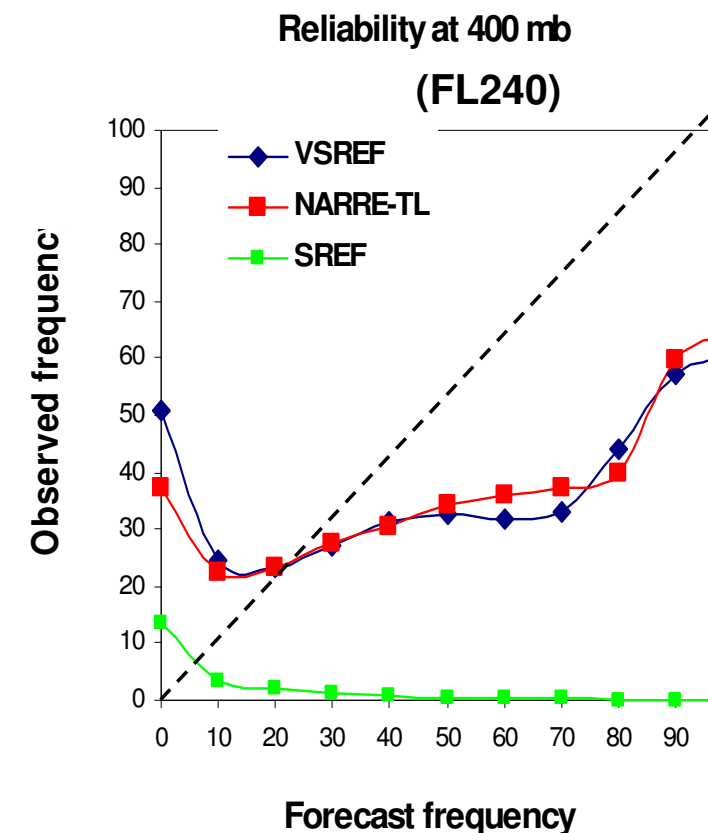

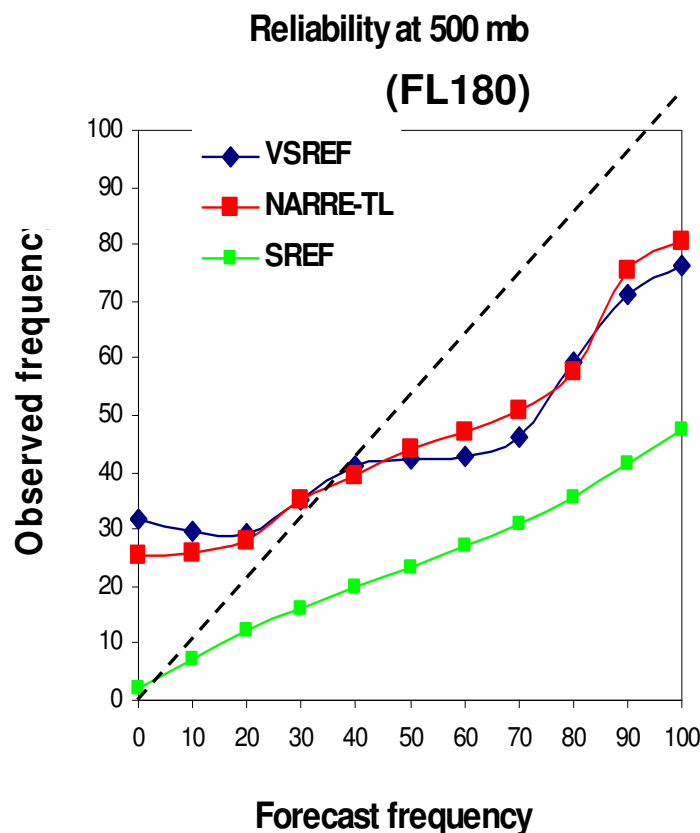

Reliability Plot

**VSREF/NARRE-TL
better than SREF**

At mid-Flight levels

All have best reliability

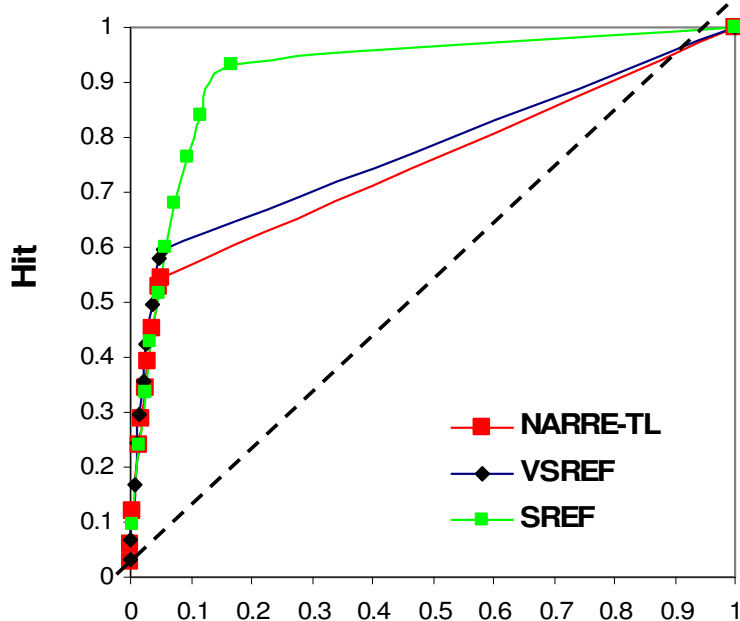

ROC at 900 mb

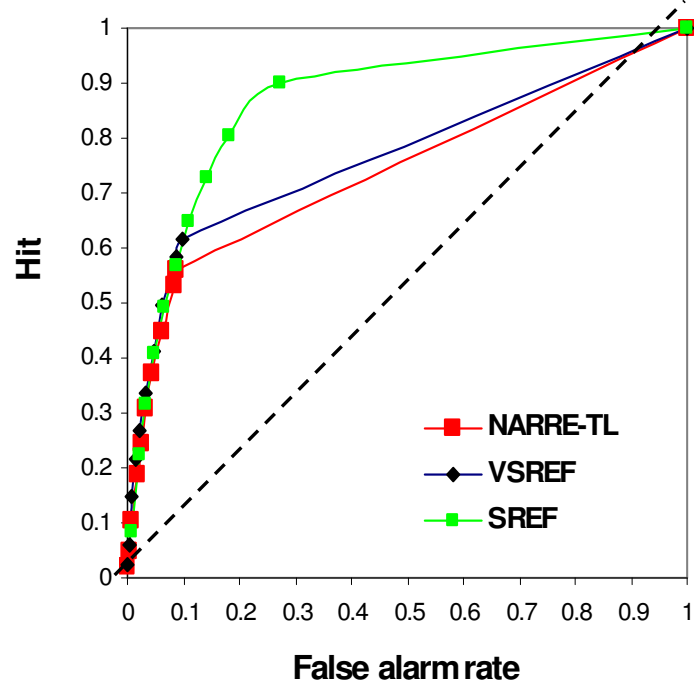

ROC at 725 mb

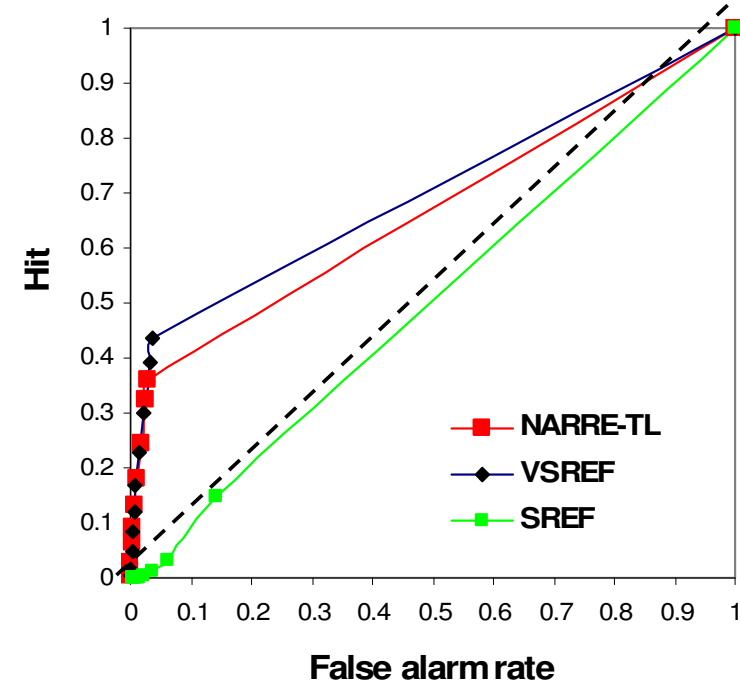

ROC diagram

All are skillful
except for SREF
at lower level

ROC at 500 mb

ROC at 400 mb

Conclusion

- Using “trace” CIP as truth, SREF/VSREF/NARRE-TL were verified over 60 days over CONUS
- Except for very high/low levels, SREF/VSREF/NARRE-TL icing probability forecasts have ETS score around 0.2~0.3 ~ to Precip but worse than FIP
- Very high/Low levels icing prob forecasts has worse scores
- Reliability plots: VSREF ~ NARRE-TL better than SREF
- VSREF/NARRE-TL/SREF have good ROC score except for SREF in very high levels
