# Weather Impacts and Routing Services in Support of Airspace Management Operations (for the Army)

**Jeffrey Johnson, David Knapp (briefer), David Sauter**  
david.i.knapp.civ@mail.mil

*Technical POC: Jeffrey O. Johnson*  
*jeffrey.o.johnson.civ@mail.mil*

4 August 2011

**TECHNOLOGY DRIVEN. WARFIGHTER FOCUSED.**

Approved For Public Release; Distribution Unlimited

# Outline

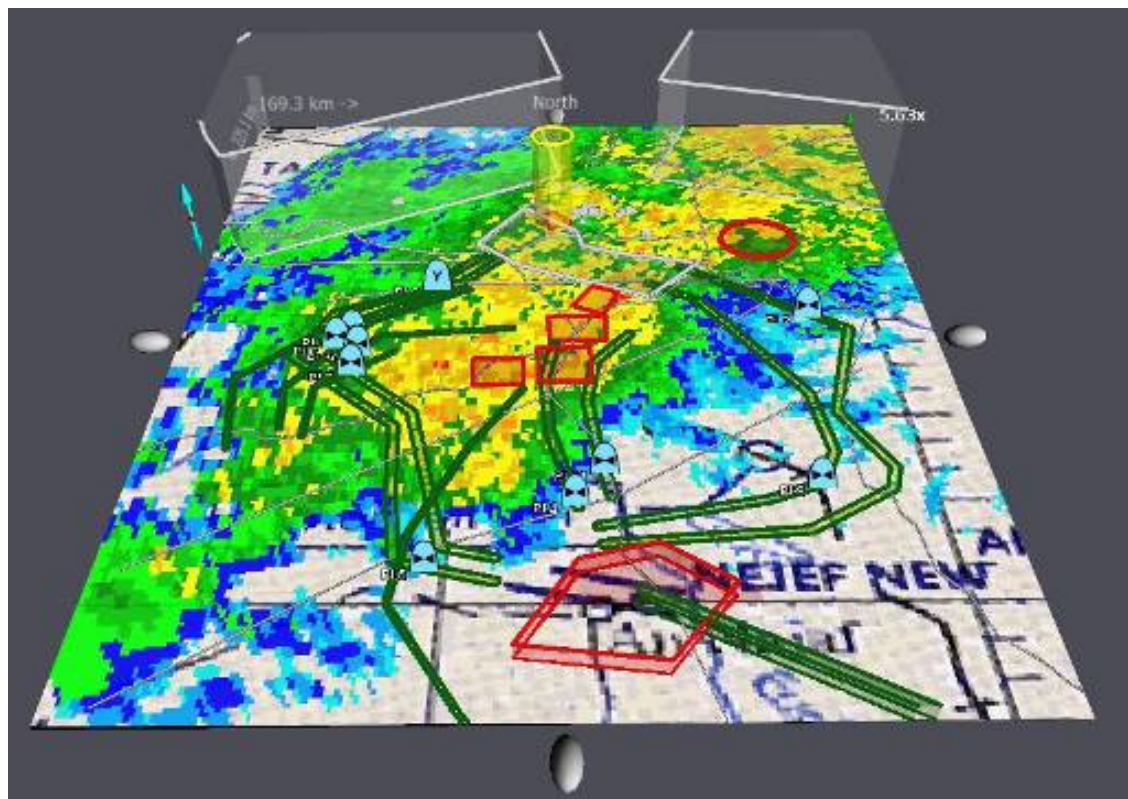

- Army Airspace Management Ops
  - Tactical Airspace Integration System (TAIS)
- Weather Impacts
  - My Weather Impacts Decision Aid (MyWIDA)
- Routing
  - Atmospheric Impacts Routing (AIR)
- TAIS / ARL Web Services Interoperation
- Summary

# Tactical Airspace Integration System (TAIS)

## TAIS Mission

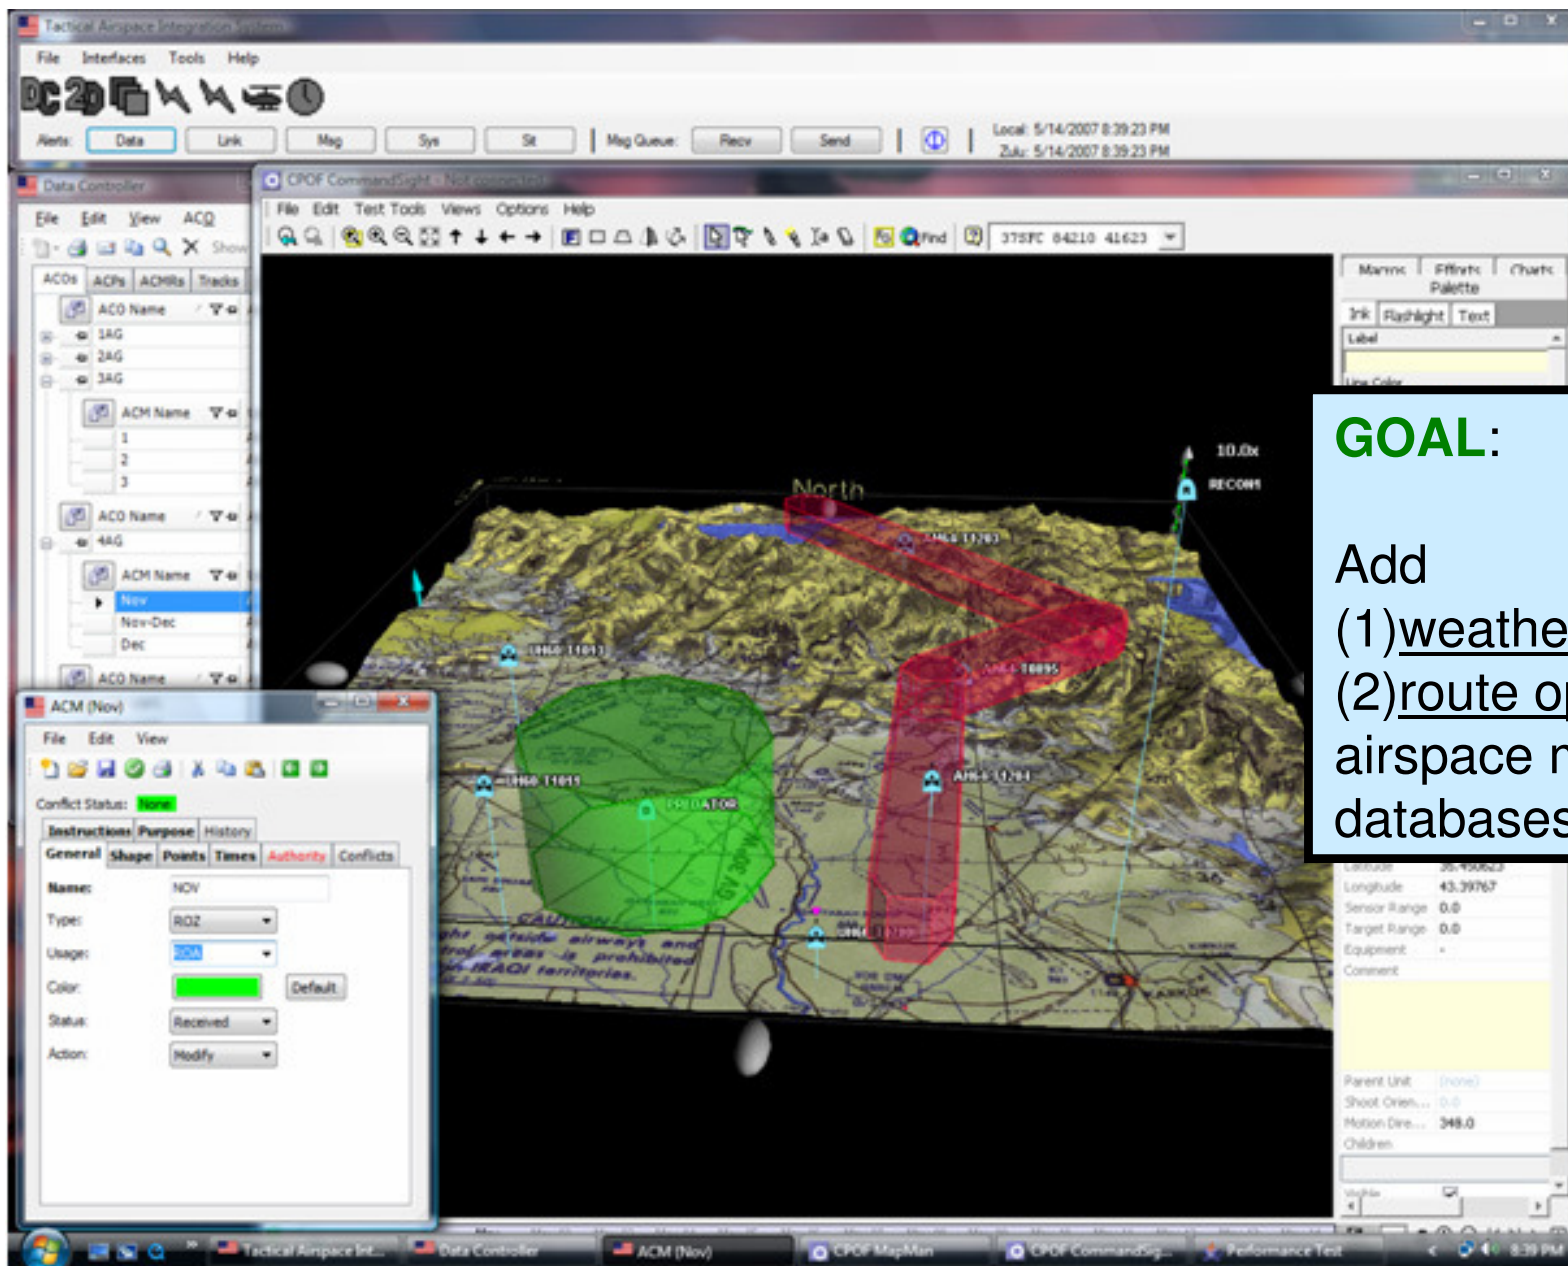

**Provide automated Airspace Command and Control and enroute Air Traffic Services to users.**

**When Current Ops domains and Airtracks are displayed, operational impacts of weather on the airspace become readily apparent.**

# TAIS Visualizer

## GOAL:

Add  
 (1) weather impacts and  
 (2) route optimization to  
 airspace management  
 databases & depictions

**TECHNOLOGY DRIVEN. WARFIGHTER FOCUSED.**

# STEP 1: Weather Impacts

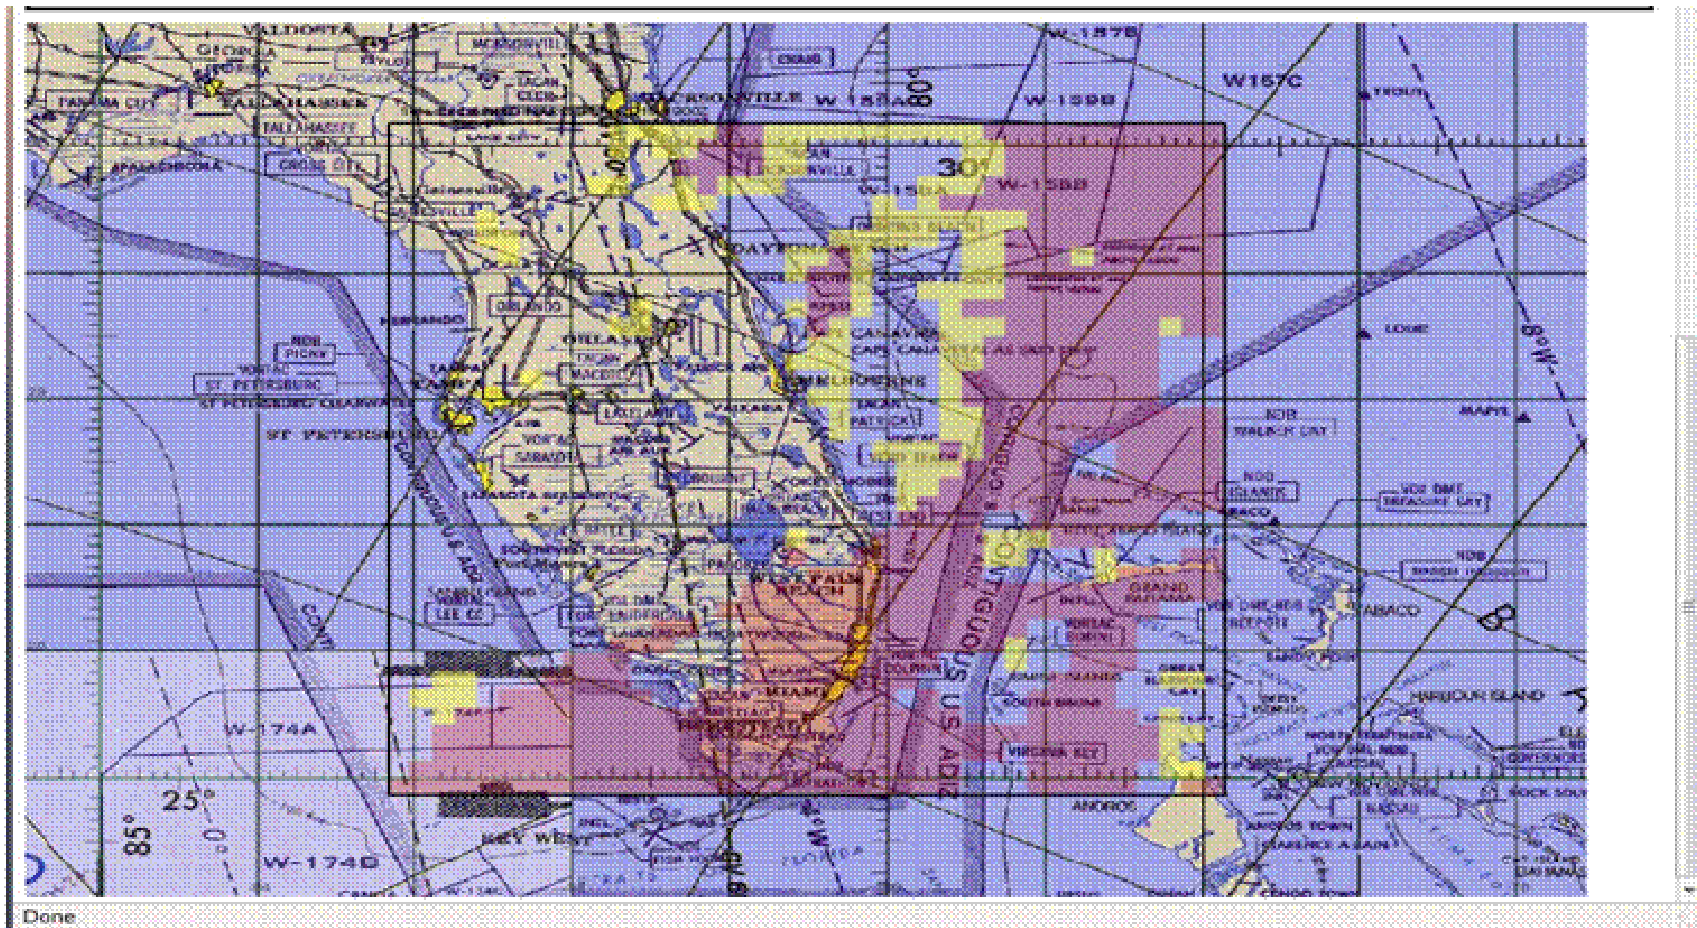

MyWIDA = My Weather Impacts Decision Aid

- Provides weather impacts on assets (missions, operations, systems, equipment, resources, infrastructure).
  - Compares critical thresholds (rules) against observed/forecast values.
  - **FOR AVIATION:** Allows users to create mission-specific critical thresholds tailored for individual aircraft, routes, and airspace domains.
- Results presented as red/yellow/green “stoplight” depictions of unfavorable/marginal/favorable weather conditions.
- Fielded operationally in the Army.

# MyWIDA v1 Map Depiction

# MyWIDA Summary

## MyWIDA v1

- Portable/Tactical: Runs on Windows PC/Laptop systems.
- LAN connectivity needed for data retrieval.
- Selectable Area Of Interest, Forecast Periods, & Model Data.
- **Beta version available now for testing.**

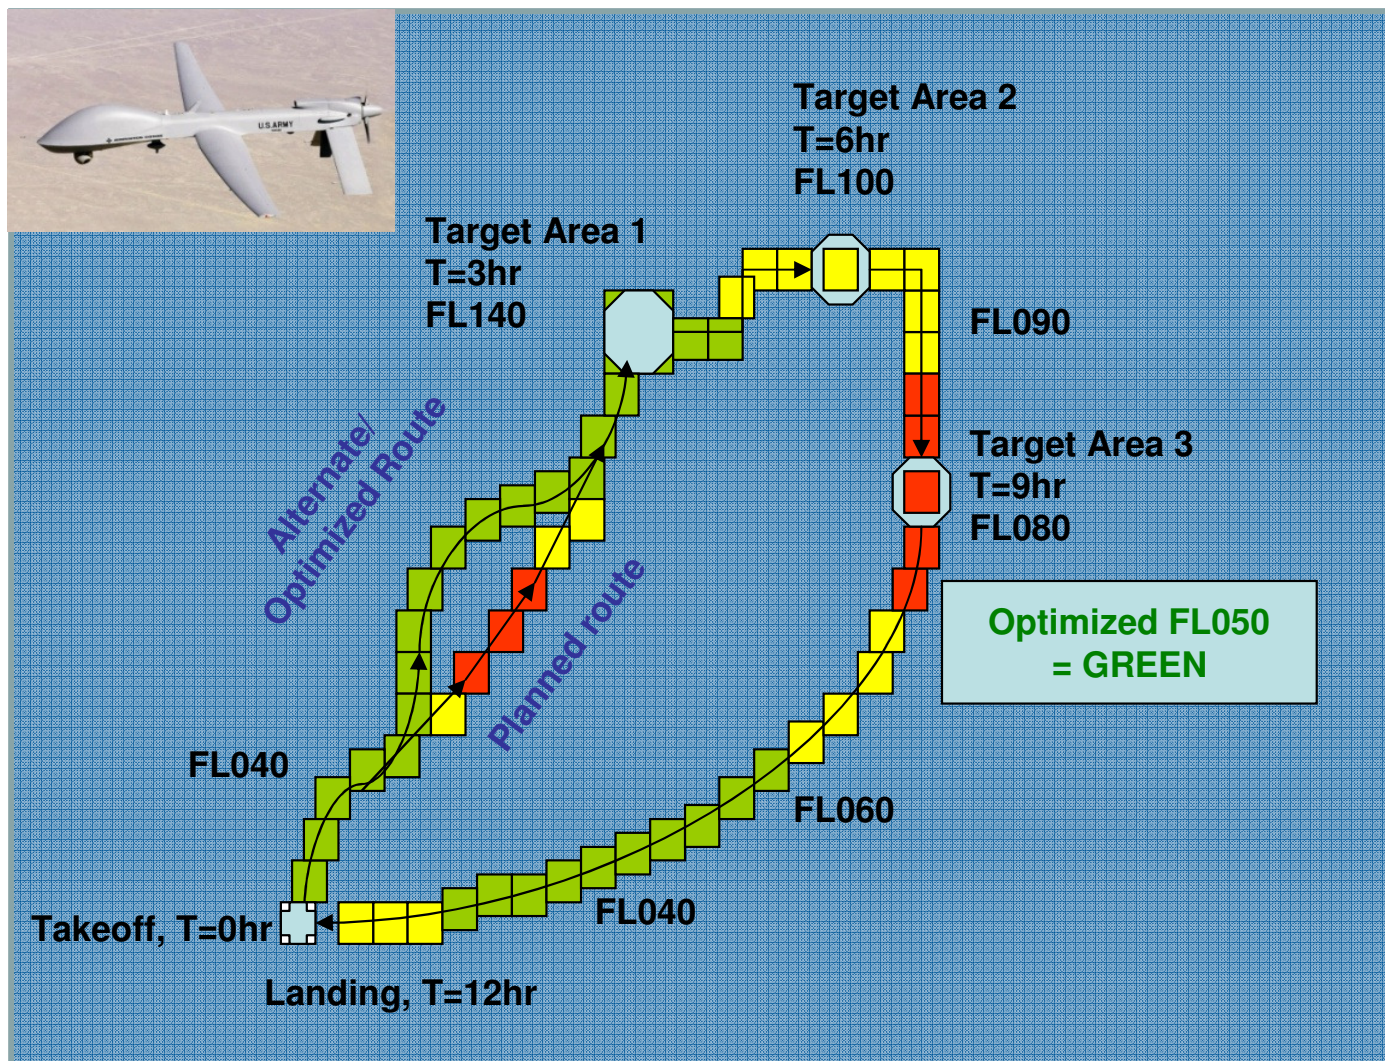

## MyWIDA v2

- Web Services implementation.
- Multiple forecast data sources: NWS, AF, Navy, etc.
- Multiple AOIs and more color granularity for R-Y-G transitions.
- 3D/4D visualizations via Google Earth and/or other options.
- Data output formats aligning with industry standards (XML, KML, etc.).
- **MyWIDA will be providing weather impacts data for TAIS**

# STEP 2: Route Optimization

# Route Optimization Concept

**New** 4D Weather Forecast Grid

+

Aircraft-Specific Weather Impacts Threshold Rules

=

4D Weather Impacts Grid

+

Altered Flt Path (if needed)

New Flt Path Options; Avoiding Enrte Hazards

PATH

Initial/Current Flight Path

OPTIMIZATION ALGORITHM

# Route Optimization via the AIR app

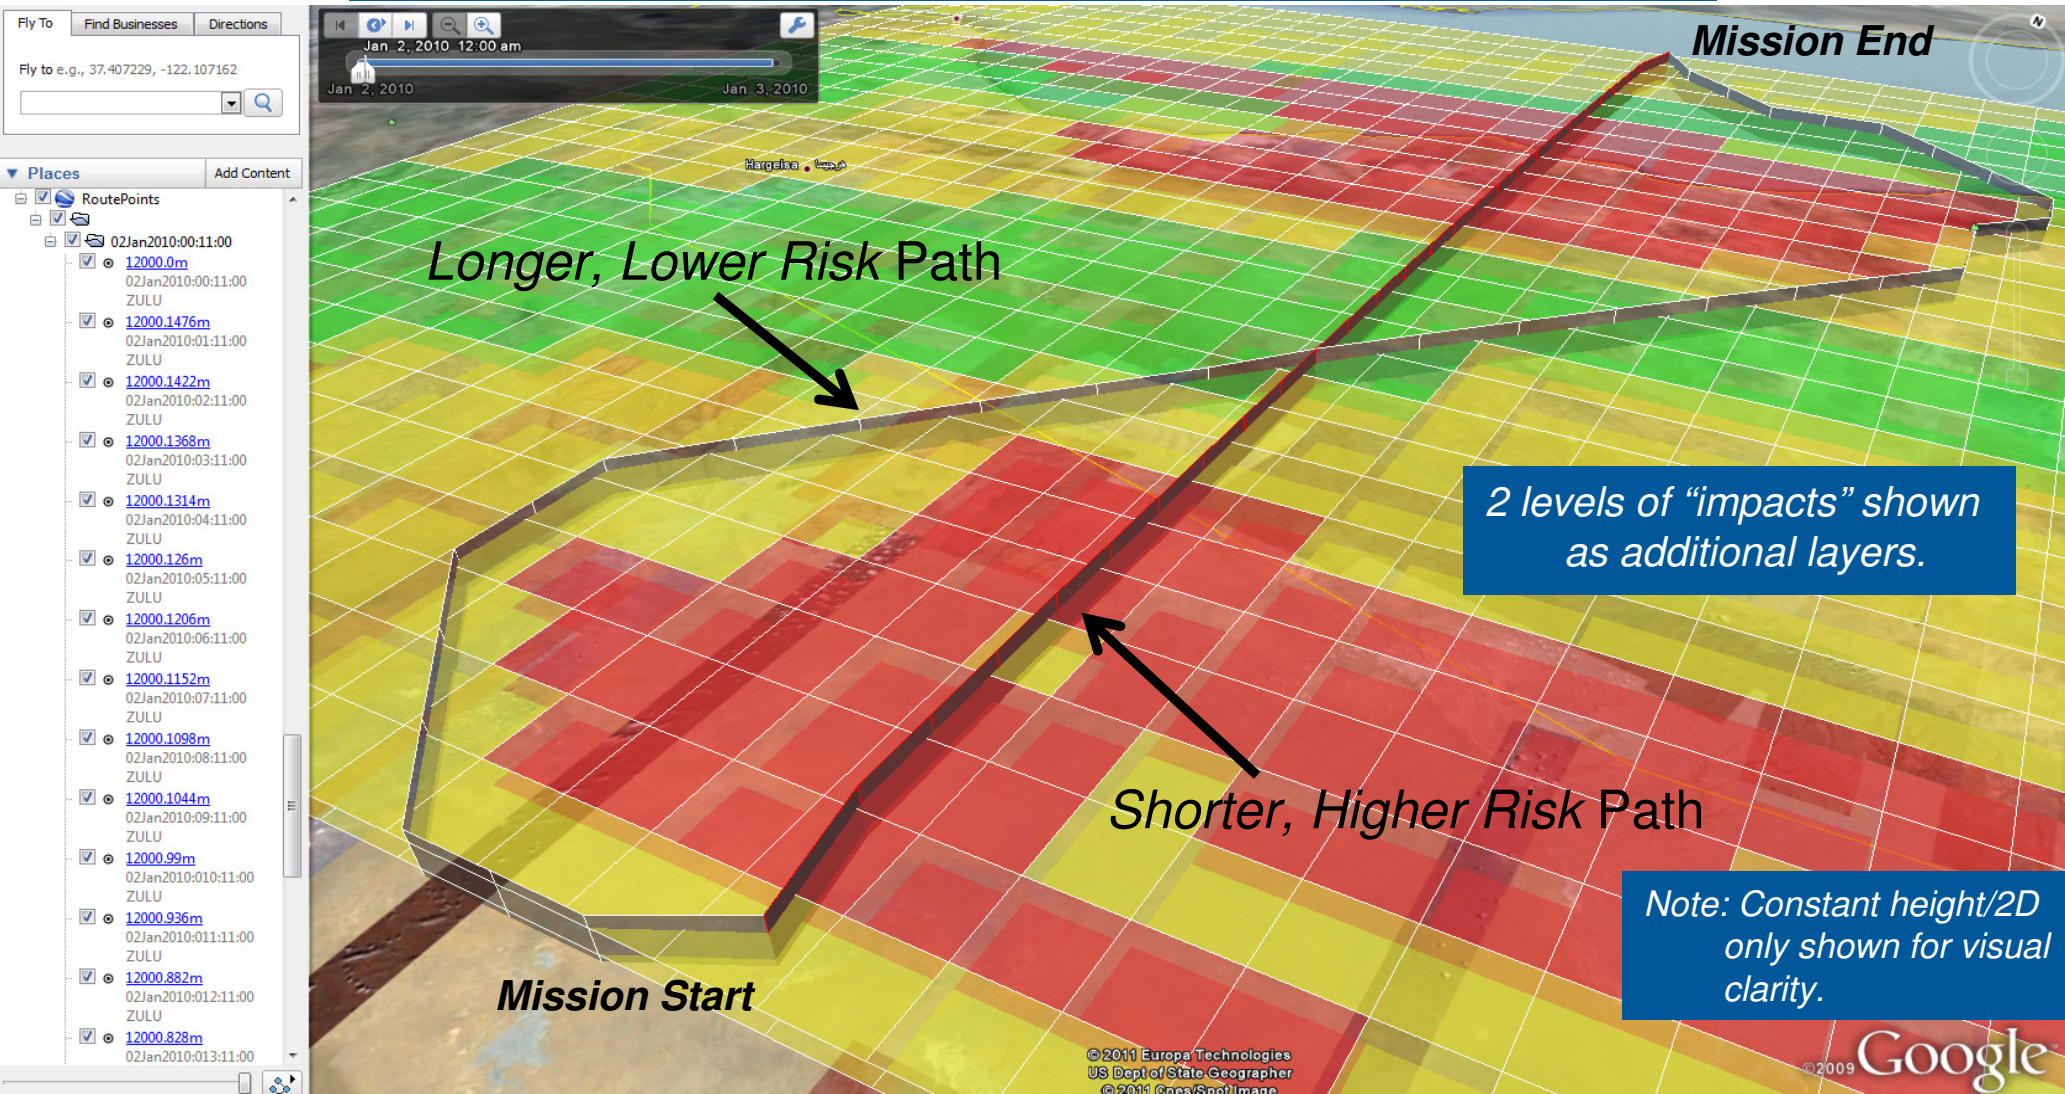

- **AIR** calculates an optimized air system route based on atmospheric impacts and obstacles along the path. *Path optimization employs A\* search algorithm. Data structures support other algorithms (e.g., D\*).*
- **AIR Qualities:**
  - Written in Java (platform independent).
  - Ingests 3D/4D weather “impact” gridded databases.
  - Allows 3D volumes to be avoided → weather “objects,” airspace conflicts, restricted airspace/aviation corridors; other obstacles represented as 3D volumes.
  - Generate output in industry standard Google Earth/Maps Keyhole Markup Language (KML).

# AIR Visualization

**AIR-generated 4D flight paths as "playback files"  
(Google Earth KML output format)**

**TECHNOLOGY DRIVEN. WARFIGHTER FOCUSED.**

# AIR Current Status

- ***AIR Web Service*** (and reference client) prototype developed and successfully test-deployed on web service application server (Glassfish).
- ***AIR View standalone (w/GUI):***
  - Output:
    - 2D plot (Java 2D graphics) including move time (hrs) and distance (km).
    - Google Earth KML output of optimized path.
    - Google Earth “fly-thru tour” along optimized path.
  - Can run from a CD.

# AIR Current Status

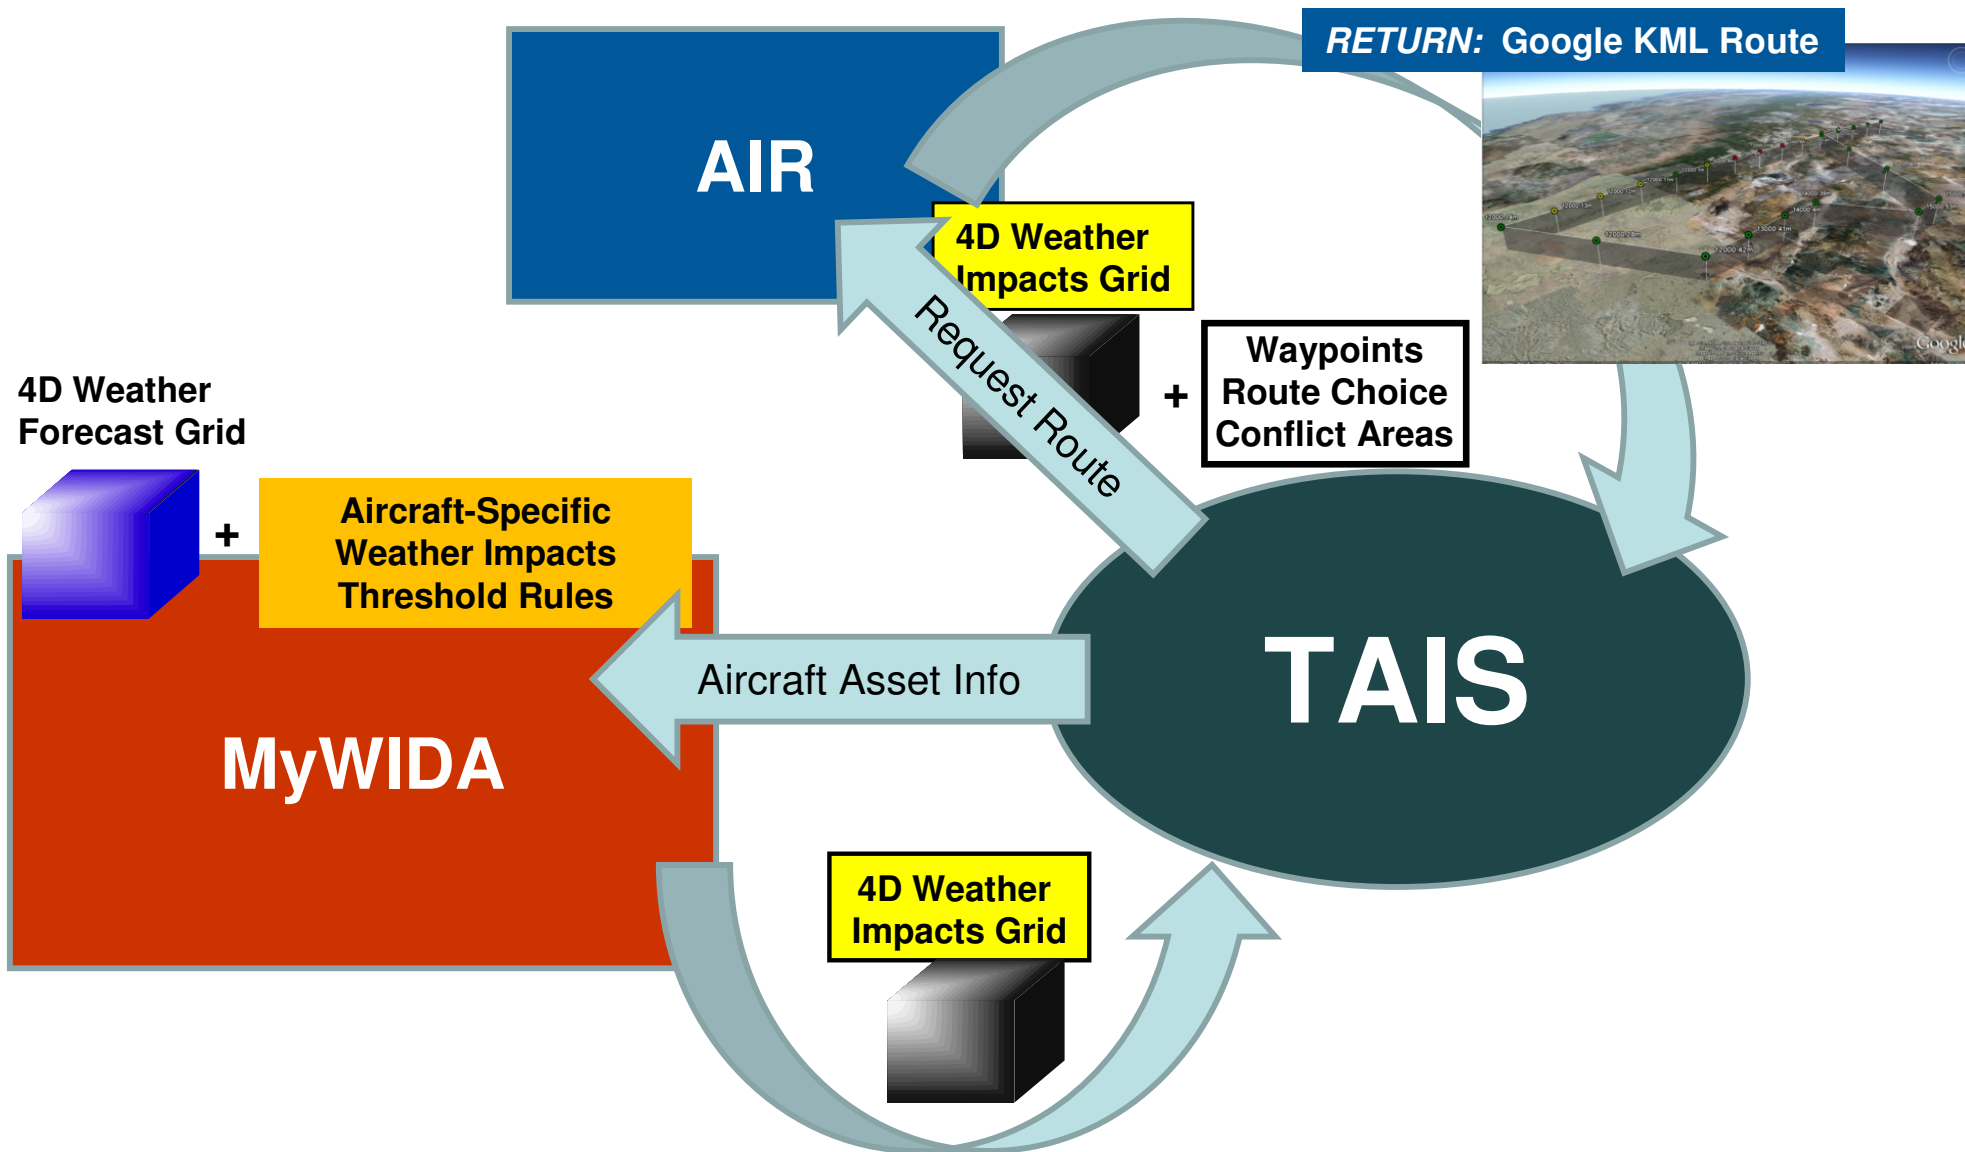

## *AIR – Current Capabilities:*

- User inputs:
  - Path (two or more waypoints) and aircraft speed (m/s).
  - Choice of “lower risk” or “higher risk” routes.
  - Boundaries – vertical, horizontal, or 3D volume (e.g., restricted airspace and “no-fly” zones).
- Output:
  - Google Earth/Maps KML AIR-generated *optimized path*.
- Prototype Demonstration:
  - Calculates approximately 1000 potential paths/routes per second in 3D space.
  - Successfully tested on multiple platforms (Windows, Linux).

# TAIS, 3D Weather Impacts, and AIR

# Summary

- We're on the way to successful integration of weather impacts grids and air route optimization into Army airspace management.
  - Weather impacts capability (MyWIDA) suitable for a wide variety of decision-making needs, not just aviation.
  - The Atmospheric Impacts Routing (AIR) application and web service are being transitioned to Army operators this year.
    - AF Weather Agency will also receive the AIR app this year.
  - AIR and MyWIDA output = industry standard Google KML.
- MyWIDA and AIR technologies are suitable for non-DoD applications.
