

# 3.4 Thanksgiving 1996 Lake Effect Snow in the Lake Champlain Valley

Paul A. Sisson and Robert L. Deal

NOAA/National Weather Service  
Burlington, Vermont

# Acknowledgements

- Robert Deal and NWS Burlington office
- Dr. Robert Rozumalski - NOAA/NWS Science and Training Resource Center (STRC) and Unified Environmental Modeling System (UEMS) Coordinator

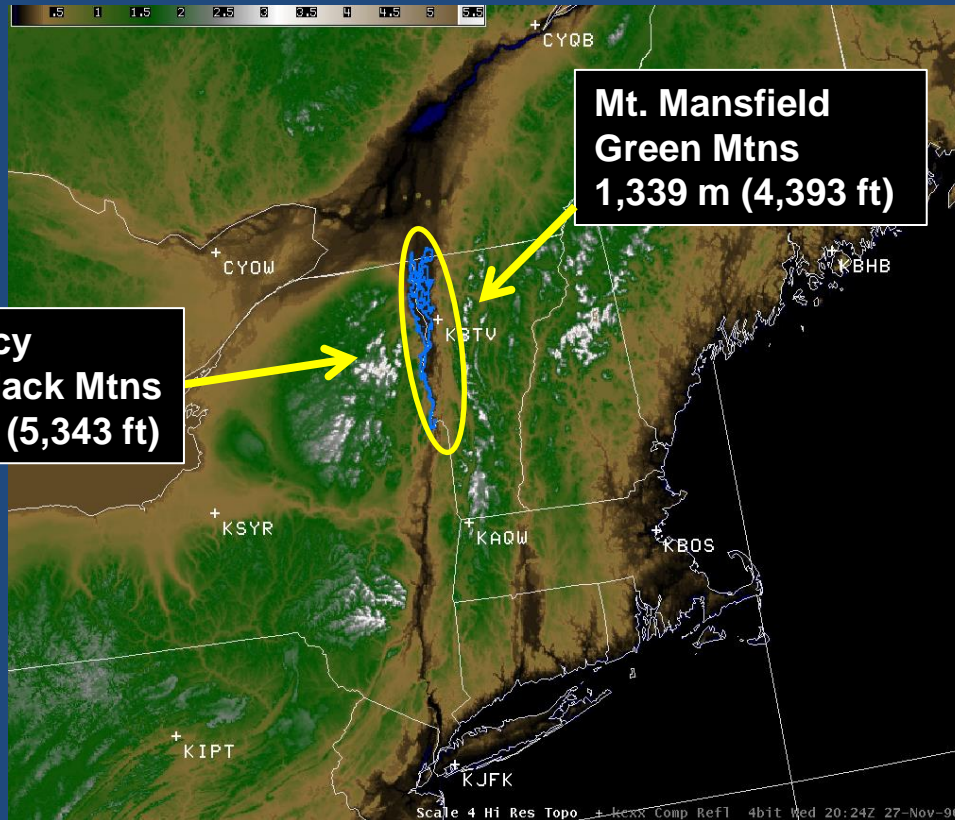

# Outline

- Can we expect high-resolution models to reproduce Lake Champlain lake-effect snow in time to make operational forecasts?
- Previous work - climatology
- Case of 26-27 November 1996
- WRF model results
- Summary

# Lake Champlain Vermont /New York

# Lake Champlain

- Length 200 km (125 mi)
- Max width 23 km (14 mi)
- Max depth 120 m (400 ft)
- Avg depth 20 m (66 ft)
- **Lake Champlain Islands**

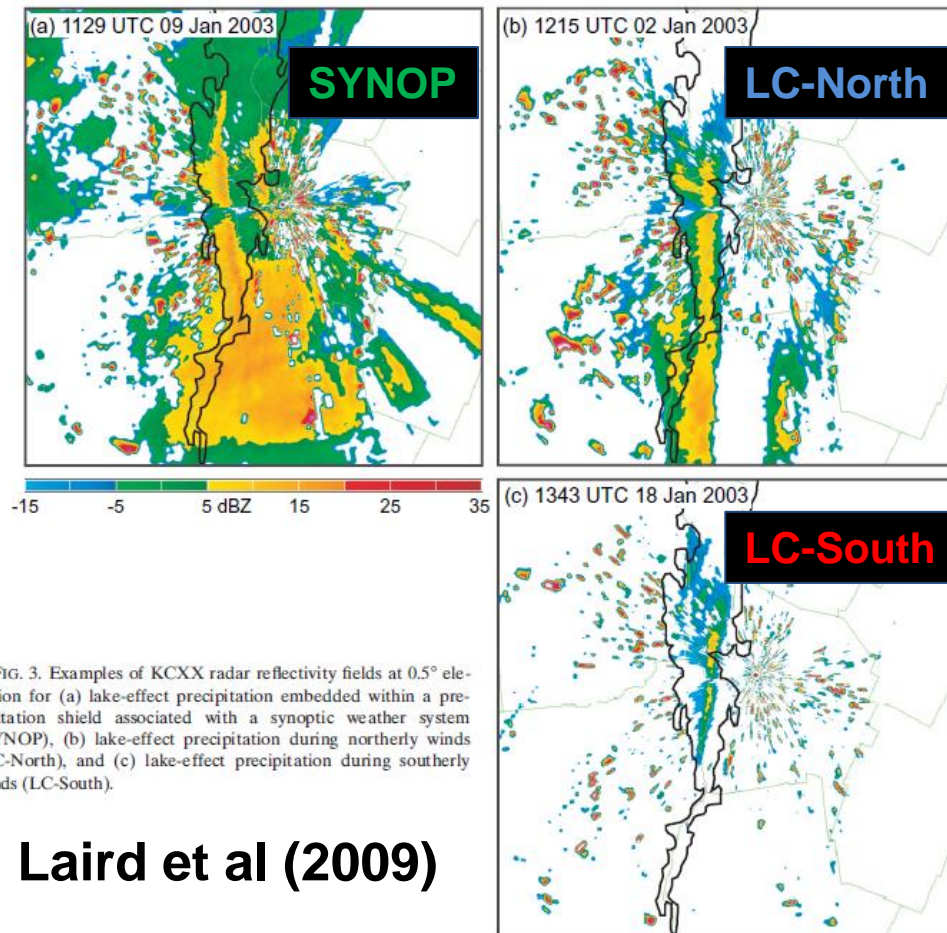

FIG. 3. Examples of KCXX radar reflectivity fields at 0.5° elevation for (a) lake-effect precipitation embedded within a precipitation shield associated with a synoptic weather system (SYNOP), (b) lake-effect precipitation during northerly winds (LC-North), and (c) lake-effect precipitation during southerly winds (LC-South).

Laird et al (2009)

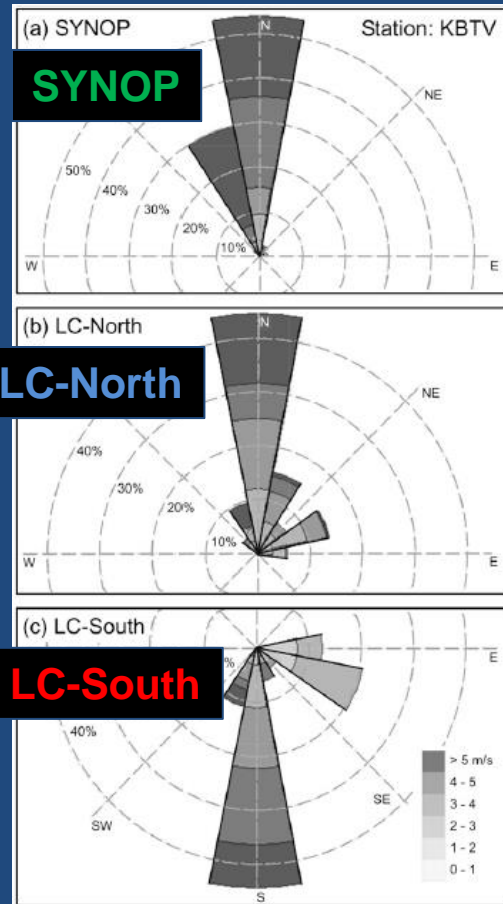

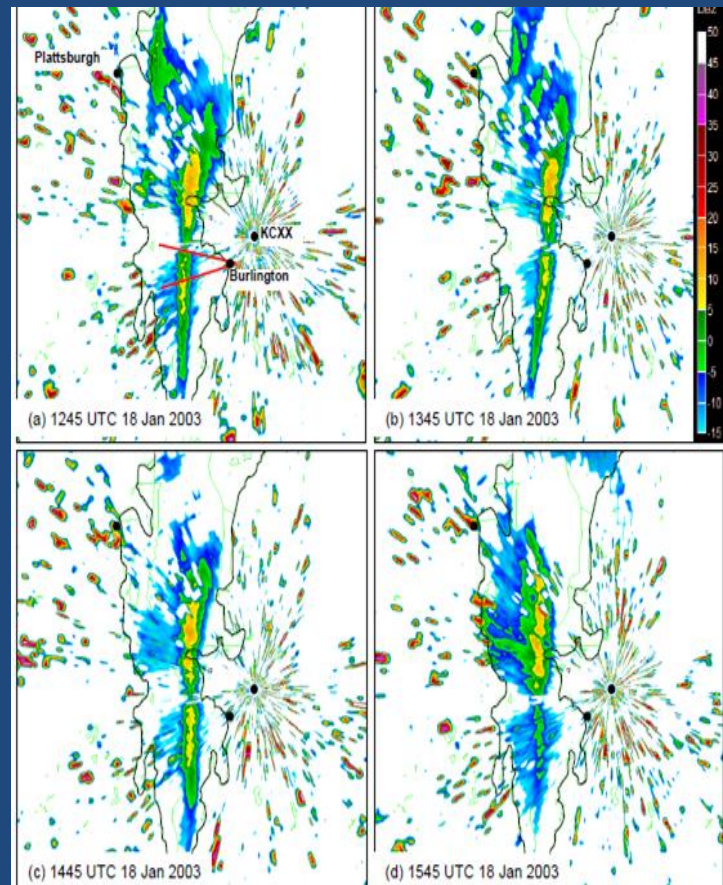

FIG. 12. Wind rose plots showing wind speed and direction information at KBTV during (a) SYNOP, (b) LC-North, and (c) LC-South events.

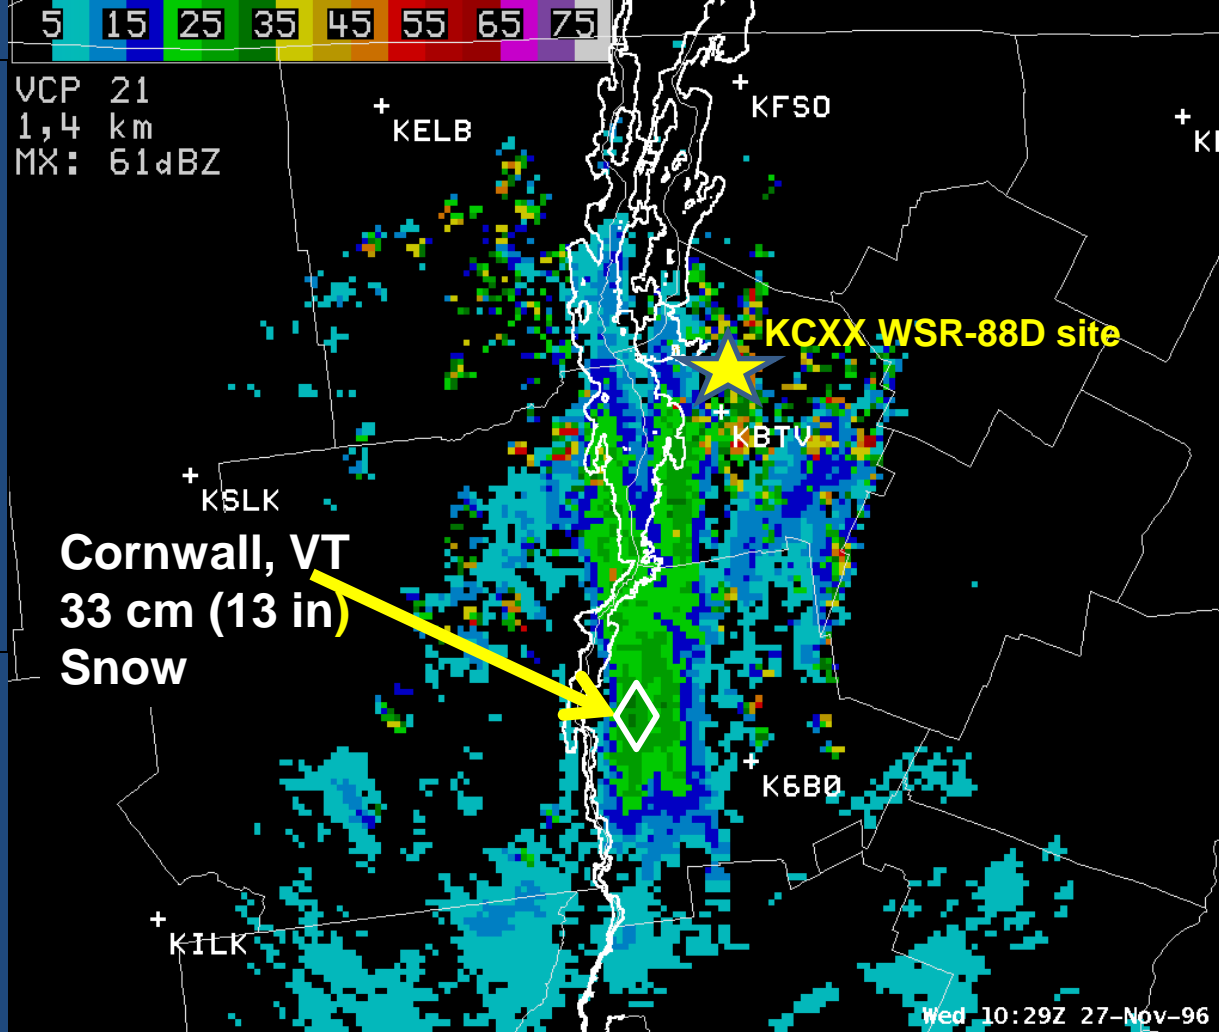

# Lake Champlain South Event

# Summary

- Convergence in Champlain Valley
- Reproduced the dual band structure
- Under predicted intensity of the band
- Operational Models at 3km or less is needed.
- Forecasters can expect some degree of success predicting Lake Champlain events using high resolution model forecasts
  - 3km High Resolution Rapid Refresh (HRRR)
  - 1km NCEP or local model nests)

# Future work

- Vary configurations to match operational models
- Vary Water Temperature

**Thank you.**
