Theoretical MPI

(e.g. Bister and Emanuel 1998)

$$V_{\max}^2 = \frac{C_k}{C_D} \frac{SST - T_0}{T_0} \left(h_0^* - h^*\right)$$
 Thermodynamic Efficiency Thermodynamic Disequilibrium

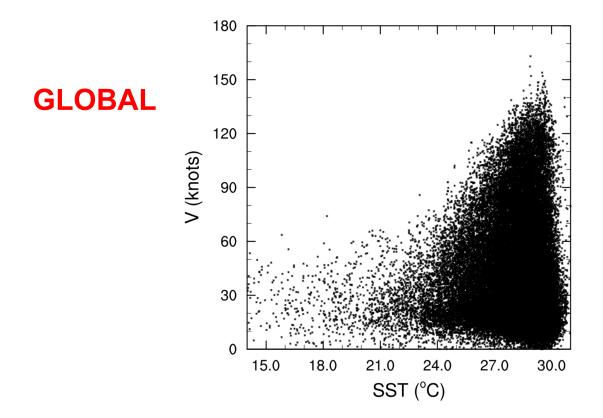

100 hPa Temperature vs SST at TC locations

Empirical MPI

(e.g. DeMaria and Kaplan 1994)

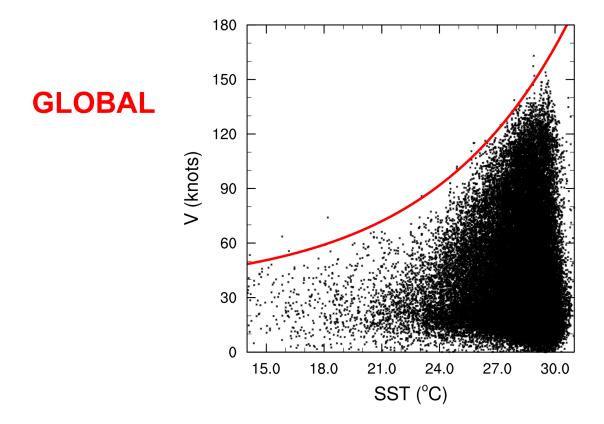

$$V_{\text{max}} = A + B \exp[C(SST - 30)]$$

Empirical MPI

(e.g. DeMaria and Kaplan 1994)

$$V_{\text{max}} = A + B \exp[C(SST - 30)]$$

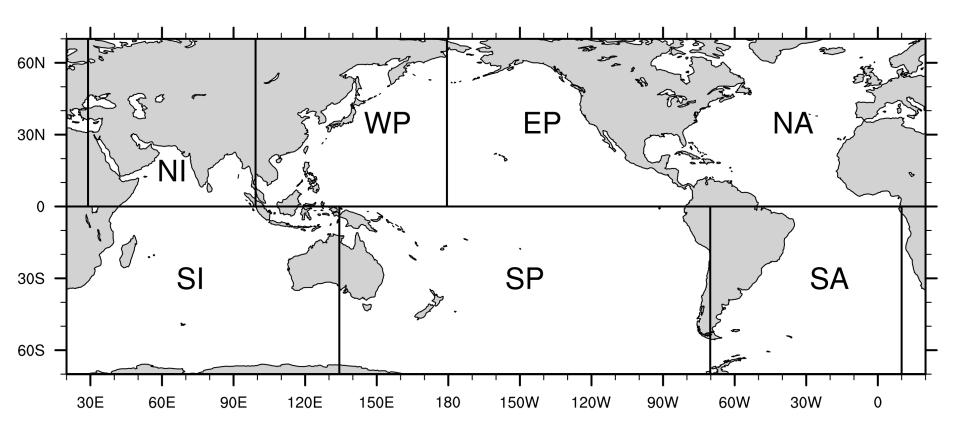

Outline

1. Are the regional MPI-SST relations truly different? (e.g. DeMaria and Kaplan 1994, Whitney and Hobgood 1999, Zeng et al. 2007)

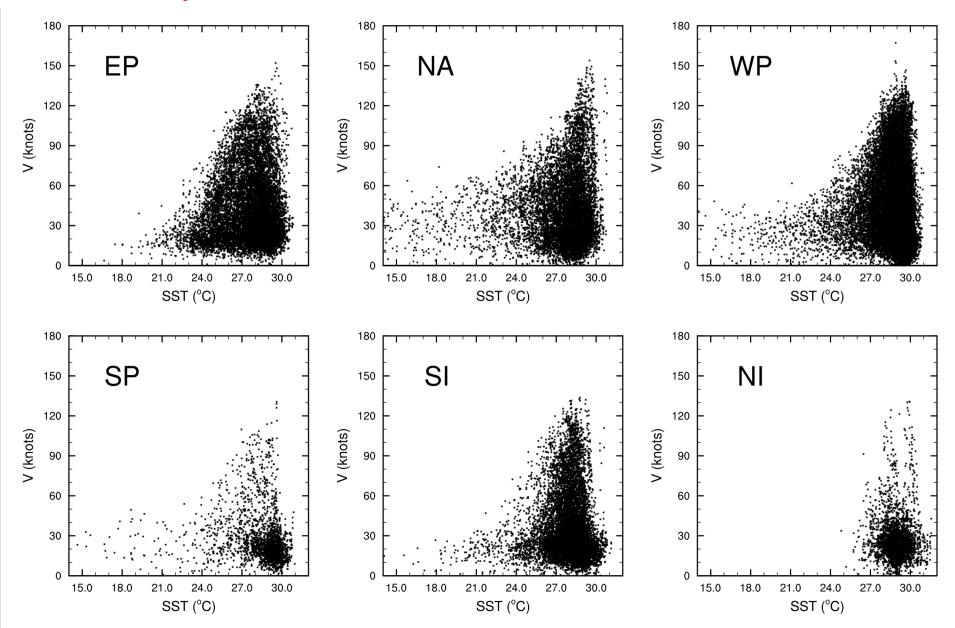

2. The problem with using maximum

Data

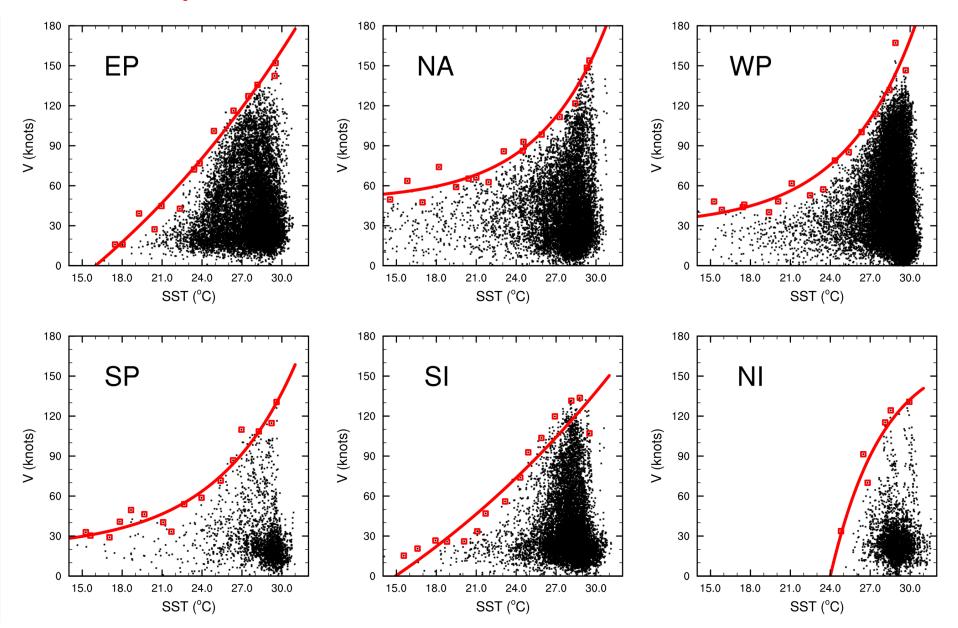

- TC positions and intensities from IBTrACS v03r05
- SST and temperature from monthly JRA-55

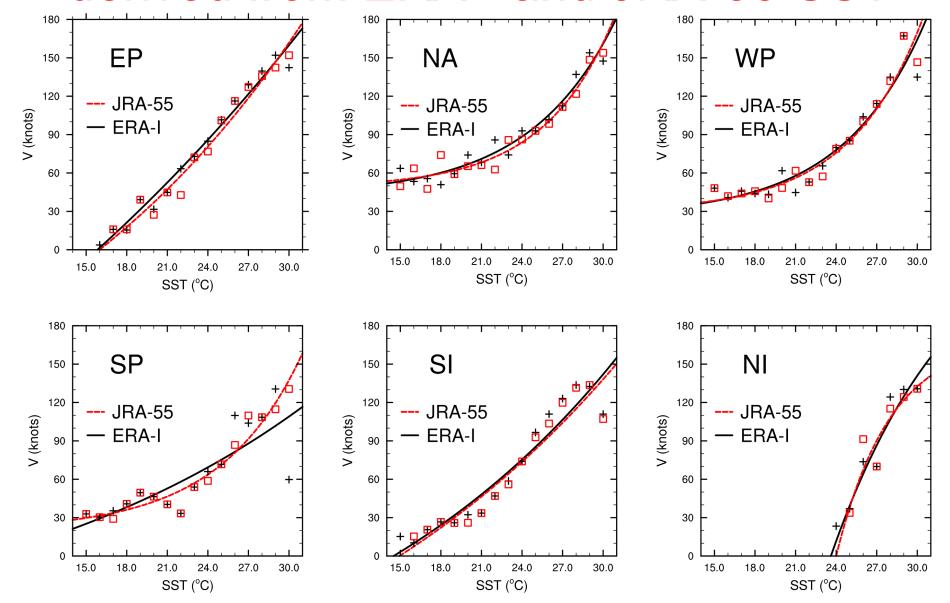

Scatter plots of IBTrACS wind and JRA-55 SST

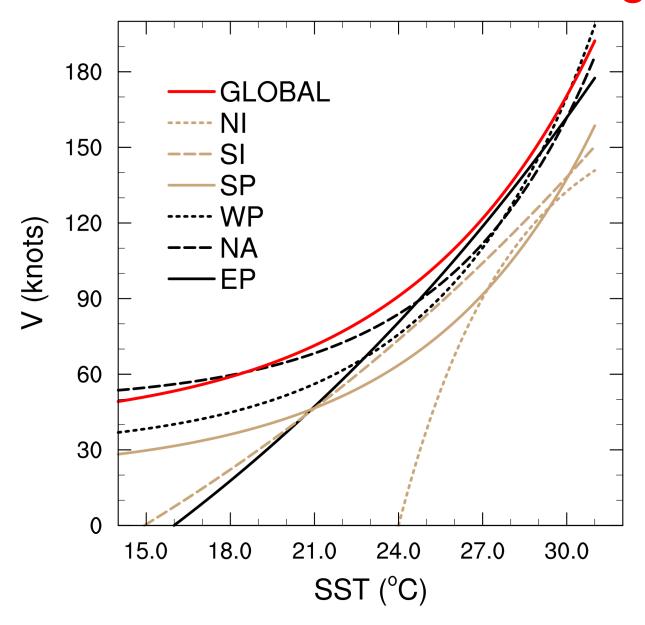

Scatter plots of IBTrACS wind and JRA-55 SST

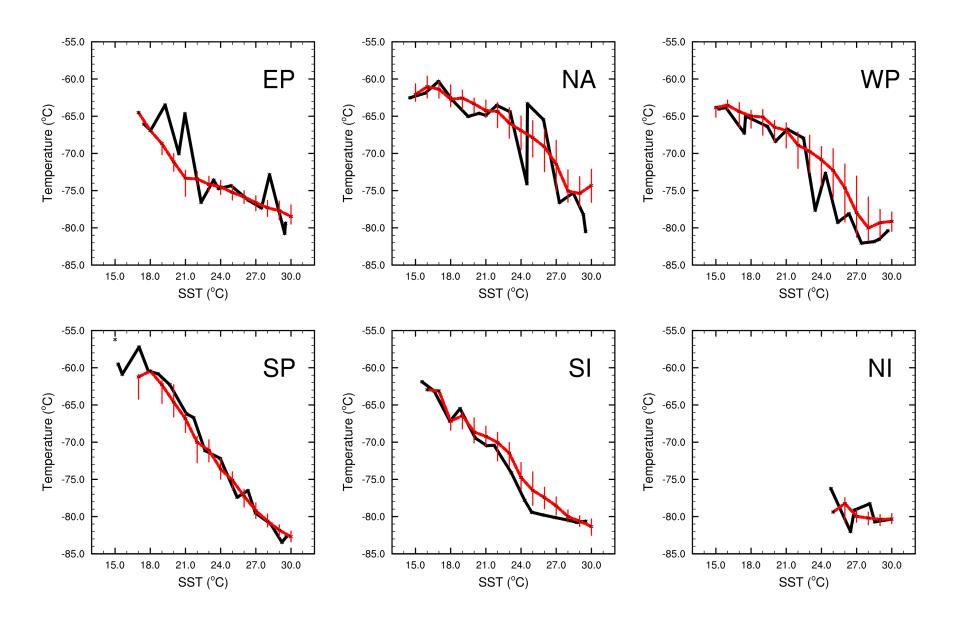

MPI-SST relations in different basins derived from ERA-I and JRA-55 SST

Fits of maximum for different regions

100 hPa Temperature vs SST for Max. Intensity

Problem with maximum

 Maximum is not a robust statistics. It might change if more observations are available.

 In particular, maximum is not a good quantity when we only have few data points.

 Does maximum really exist in the wind distribution in the SST bin?

Exploring the robustness of maximum

Step 1: Pick SST bin with the most data.

Step 2: Randomly pick i) 10, ii) 30, iii) 100 data points from the SST bin, calculate and store the statistical measures (e.g. maximum, nth percentile)

Step 3: Repeat Step 2 10,000 times and calculate the mean of the statistical measures.

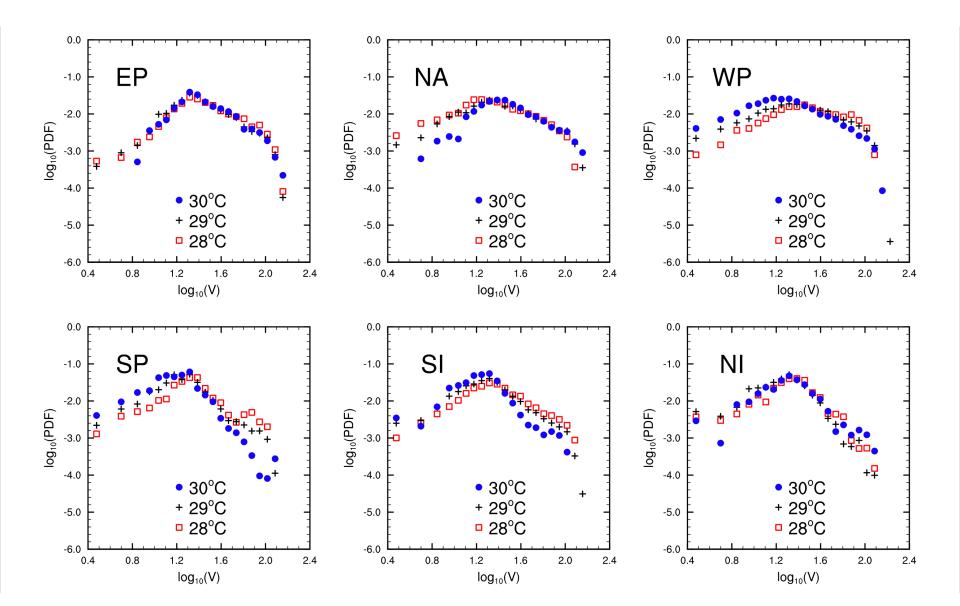

| Sample size | Statistical measure | True values | Means of measures | Standard Deviation | Percentage error |
|-------------|-----------------------------|-------------|-------------------|-----------------------|------------------|
| 10 | 50 th percentile | 39.18 | 37.42 | 11.48 | 4.49 |
| 30 | | | 38.56 | 7.00 | 1.59 |
| 100 | | | 39.01 | 3.92 | 0.45 |
| 10 | 95 th percentile | 105.77 | 99.03 | 18.79 | 6.38 |
| 30 | | | 103.17 | 11.37 | 2.46 |
| 100 | | | 103.76 | 6.33 | 1.90 |
| 10 | 99 th percentile | 121.73 | 98.63 | 18.77 | 18.98 |
| 30 | | | 114.33 | 11.53 | 6.07 |
| 100 | | | 117.28 | 6.52 | 3.65 |
| 10 | Maximum | n 167.17 | 98.91 | 18.57 | 40.84 |
| 30 | | | 114.17 | 11.62 | 31.71 |
| 100 | | | 124.41 | 8.54 | 25.58 |

| Sample size | Statistical measure | True values | Means of measures | Standard Deviation | Percentage error |

| 100 | | | 117.28 | 6.52 | 3.65 |
| 10 | Maximum | n 167.17 | 98.91 | 18.57 | 40.84 |
| 30 | | | 114.17 | 11.62 | 31.71 |
| 100 | | | 124.41 | 8.54 | 25.58 |

Wind speed distribution in selected SST bins

Comparison of fits of 99th percentile and fits of max for different regions

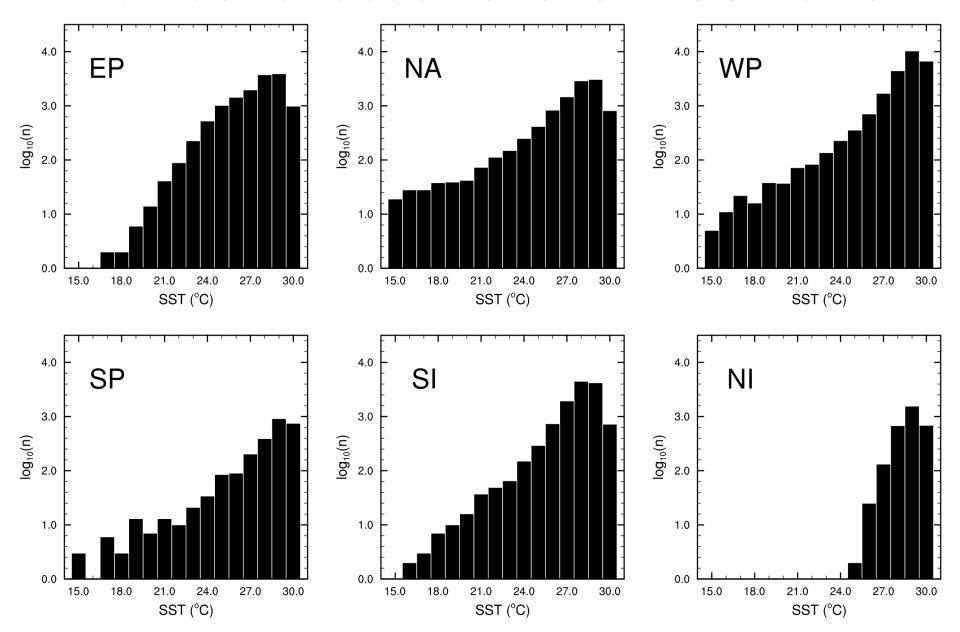

Summary

- 1. MPI-SST relation in different regions are truly different.
- 2. Outflow temperature does not seem to be responsible for the differences in the regional MPI-SST relations.
- 3. Sample maximum is <u>not</u> a good quantity to use because it is not robust. In the case of the lack of data, percentage error of the estimating maximum is <u>more than 40</u>.
- 4. 99th percentile should be used because it is more robust and it only has 1 in 100 chance of underestimating the wind speed.
