

► Dew Point Bombs: Large Model Errors Provide An Obvious Target of Opportunity for Fire Weather Forecasters

John Banghoff - NWS State College, PA

Collaborators:

Rob Radzanowski, Michael Colbert, Michael Jurewicz, Sr. (NWS CTP)
Pat Baumann, Maxwell Katsouros (Penn State University)

AMS 14th Fire and Forest Meteorology Symposium | May 3, 2023

Motivation/Problem/Opportunity

- ▶ There are specific spring days where models/our official forecasts **badly overestimate minimum relative humidity** (forecast RH significantly too high).
- ▶ PA Fire Weather Partners (Bureau of Forestry, Allegheny National Forest) told us they **often divide our minimum RH forecasts by 2** in order to be adequately prepared for fire weather potential.

Motivation/Problem/Opportunity

31°F

- ▶ Actual Dew Point Reported:

18°F

- ▶ Forecast Error:

+13°F

Dew Point Bombs

- ▶ NBM Dew Point Forecast:

21° F

- ▶ Actual Dew Point Reported:

4° F

- ▶ Forecast Error:

+17° F

Diving into the Data

- ▶ 110 dew point bomb cases from 2013-2021
- ▶ ASOS sites in central PA
- ▶ Forecast guidance from NAM sounding profiles
- ▶ Observed data from Weather Underground

Minimum Observed RH values

Many cases fall in 20-30% range, which is critical for Red Flag Warning criteria in Central PA.

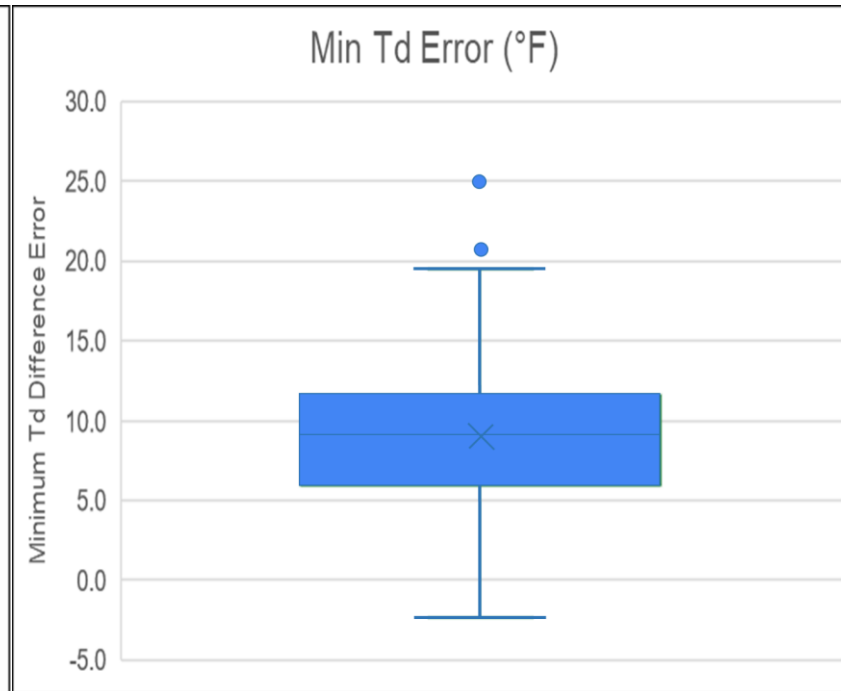

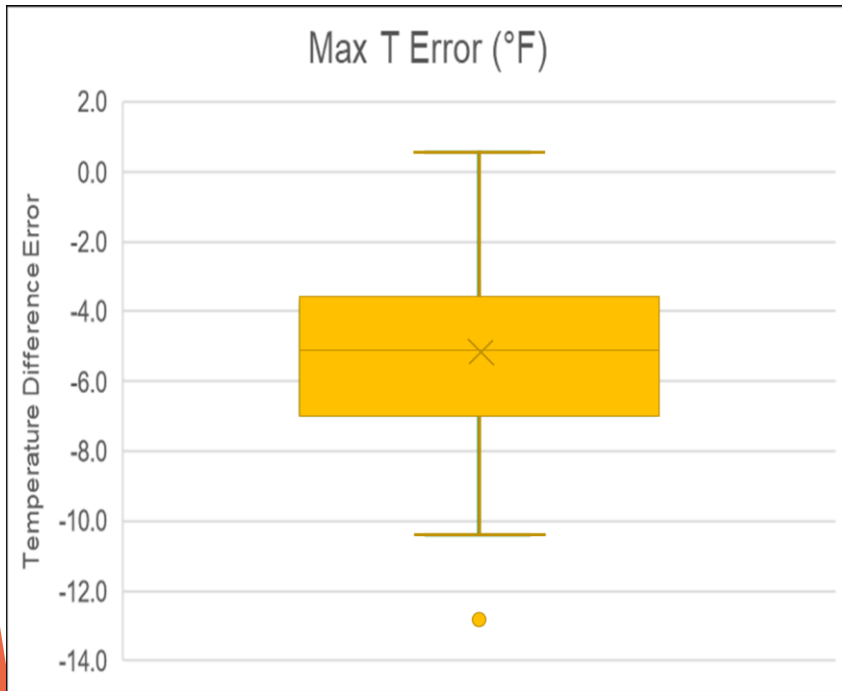

How far does the dew point drop?

Magnitude of the drop is most often in the 10-20 °F range.

T, T_d, and RH Errors

Dew point error is the biggest contributor, but temperature errors contribute, too.

We believe these errors are fixable, but we need to build more confidence to drop dew points by 10 or 15 °F from guidance.

Sounding Analysis: Dew Point Bomb Ingredients

00Z 22 Mar 2021

72520 PIT Pittsburgh

The **inversion strength** plays a major role in dew point bomb potential.

This Skew-T * **DID** * produce a **10°F** T_d Bomb.

Once mixing begins and dry air gets pulled down, **the dew point begins to drop.**

BURNING QUESTION:

HOW FAR WILL THE DEW POINT DROP??

Qualitative Rule-Of-Thumb

- ▶ Our preliminary findings show that the magnitude of the **MAX dew point drop** under ideal conditions is about **“1/4 to 1/3” the length of the horizontal portion** of the dew point plot line on the sounding.

Identifying Dew Point Bomb Potential

- ▶ Very inefficient to click through a bunch of soundings...can we look at broader geographic areas?

- ▶ **INGREDIENTS FROM SPC MESOANALYSIS:**
 - ▶ Weak or No Inversion
 - ▶ Low-level (0-3km) Lapse Rates $> 7^{\circ}\text{C}/\text{km}$
 - ▶ Dry air above the boundary layer
 - ▶ LCL-LFC Mean RH $< 30\%$

Sounding Examples: 4/6/21 at ~5PM

What Happened?

Dew point bombs occurred in BOTH areas!

In the Northeast...

Highlights:

- ▶ AVP went from 24°F to -3°F!
- ▶ HZL went from 21°F to -4°F!

Overview:

- ▶ At least 12 Sites had dew point bombs, many in the 15-20°F range.
- ▶ AVP / HZL / ABE / BGM / ELM / ALB / SYR / RME / ITH / MSV / EWR / JFK

In the Southeast...

Highlights:

- ▶ Occurred across a large area, from NC-SC-GA into FL.

Overview:

- ▶ At least 12 Sites had dew point bombs, but many other sites did not fall 10°F.
- ▶ AGS / GSP / FAY / HKY / CHS / SAV / VLD / VDI / ABY / CSG / ECG / TLH

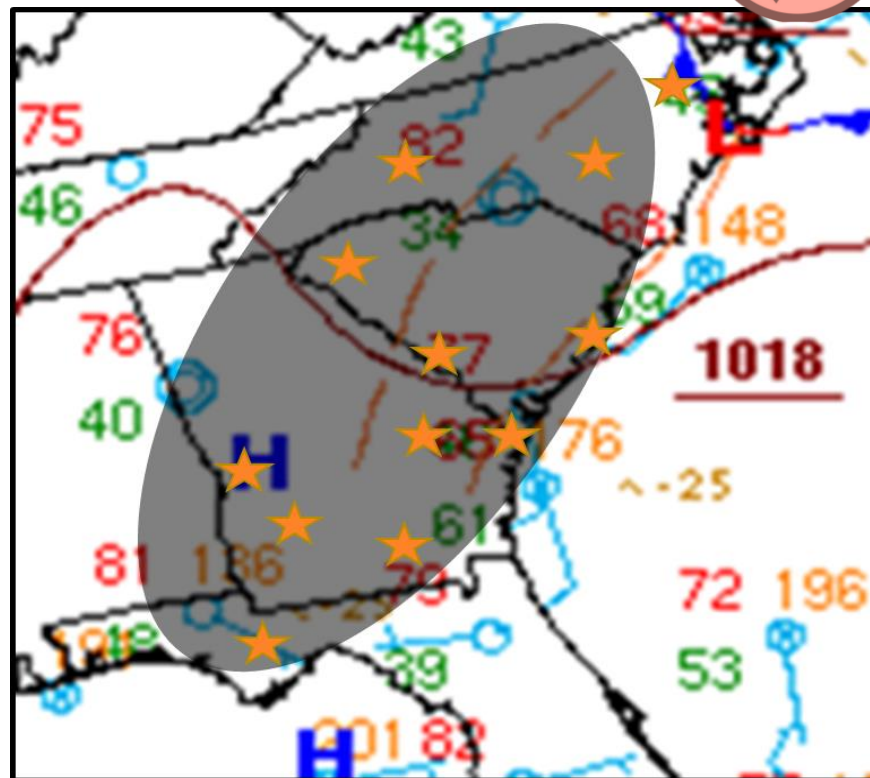

What Happened?

Min RH values of **10%** to **20%** possible across PA

Model Performance Wrap-Up

- ▶ Some models have a clue, but the “Blend” falls short.
- ▶ We have shown that these dew point bombs are a sure-fire Target of Opportunity and forecasters can significantly improve model forecasts.

FUTURE MODEL VERIFICATION ACTIVITIES:

- ▶ Daily tabulation of T/Td/RH forecasts and observations since April 2021 yet to be analyzed.
- ▶ Bulk analysis of sounding data planned for this summer with a Hollings Scholar from Penn State.

Other Operational Efforts

Dew Point Bomb Guide for Forecasters

T/Td/RH Forecasting Best Practices

RH CLIMATOLOGY:

- 30%: March - November 12p
- 20%: March - (downslope)

DEWPOINT BOMB:

Type 1: Building Canals

- Canadian High
- Clear Sky in afternoon
- Breezy Northwest
- Cold Air Advected

Type 2:

- C
- C
- L
- D

SKEW-T ANALYSIS

- With very dry air should be minimized
- If the Temperature left, confidence markedly increased

T/Td/RH Forecasting Best Practices
NWS State College, PA

TEMPERATURE FORECASTING:

- NBM MaxT grids are often 1-2°F higher than the maximum of hourly T grids.
- Copy MaxT grid into 20Z or 21Z grid (based on time of year) and interpolate.
- RH errors from T alone can be a few percentage points

DEWPOINT FORECASTING:

- Identify presence of extremely dry air aloft based on soundings & synoptic patterns.
- Use the SPC Mesoanalysis LCL-LFC Mean RH (thermodynamics tab).

0-3km LAPSE RATE

- As a proxy for identifying days/locations with a weak or non-existent inversion at the top of the boundary layer, use the 0-3km lapse rate. Values of 7.5°C/km or higher seem to work pretty well.
- File → Procedures → Open... → SITE → OfficeLevel.xml → Td Bombs / 0-3km Lapse Rates
 - NAM12, SREF, HRRR, & RAP13
- <https://www.spc.noaa.gov/exper/mesoanalysis/new/viewsector.php?sector=16#> → Thermodynamics → Low-Level Lapse Rates (use Trends/Forecast for RAP guidance)

D2D Tools

- Plan view of dewpoint at sfc, 1km, 1.5km, & 2km
- Open Procedures → SITE → OfficeLevel.xml → Fire Wx / Td Bombs / [Model] Td-MixHgt
- Identify location of dry air aloft & target potential for highly-localized Td bombs.
- Use in tandem with 0-3km lapse rates → collocation increases potential for Td bombs.

GFE TOOLS

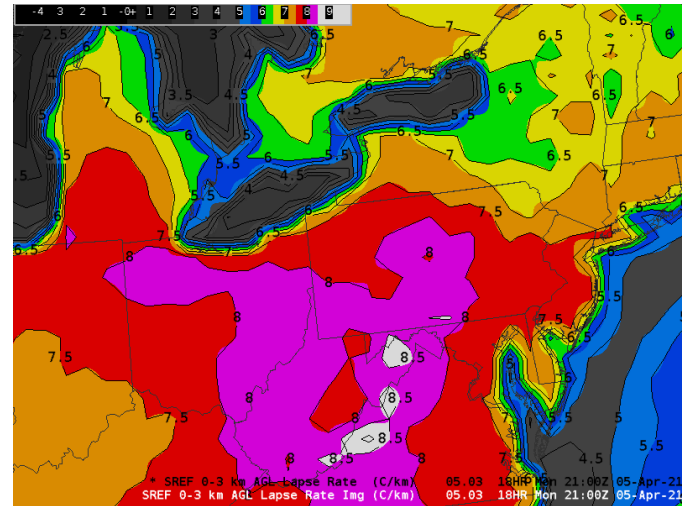

MixedDewPoint

- Calculates dewpoint from a selected model (NAM/GFS/RAP) sounding based on the Mixing Height (MixHgt) grid values.
- Make sure to run ChooseProcedures_FireWx_NBM before populating.
- Can blend with other models by publishing output from one model and then blending Official with Forecast.

NBM 10th Percentile Dewpoint

- Can blend in the medium/long range to shade Tds lower.
- To view: WeatherElement → WeatherElementBrowser... → Source → NBM10Pct
- NBM10Pct is also included in ModelBlend_ESTF tool.

In Summary

- ▶ Model (and human) forecasts of minimum relative humidity are often far too high on well-mixed dry days.
- ▶ Dew point bombs pose a significant operational impact because they often result in RH values unexpectedly dipping below Red Flag Warning criteria.
- ▶ There are identifiable environmental parameters that give us hints when they'll occur.
- ▶ Now we need to work on accurately forecasting dew point bomb magnitude AND improving models!

THANK YOU!

John Banghoff

John.Banghoff@noaa.gov

Minimum RH Climatology

ALL SITES

Frequency of $\leq 40\%/30\%/20\%$ Minimum RH

“Dew Point Bombs”

- ▶ Significant dew point drop during the day followed by a rise by mid evening.
 - T_d : Drop of $\geq 10^\circ\text{F}$ / Then a rise of $\geq 5^\circ\text{F}$ ***
- ▶ Not necessarily associated with specific RH thresholds, but almost always push RHs down into critical Fire Weather categories.
- ▶ Often equate to RHs falling 10-20% lower than expectations

Dew Point Bomb Climatology

T/Td/RH Forecasting Best Practices

NWS State College, PA

RH CLIMATOLOGY:

- 30%: March - June Noon-9p, October - November 12p-10p
- 20%: March - May 1p-8p, Mid Summer in SE (downslope)

DEWPOINT BOMB: Td drop of $\geq 10^\circ\text{F}$ followed by a rise of $\geq 5^\circ\text{F}$

DEWPOINT BOMB CLIMATOLOGY

- "Dewpoint Bombs" occur most frequently at Williamsport (THE MOST), Bradford, Harrisburg, and Selinsgrove
- Least frequent at Johnstown & Altoona.

SYNOPTIC PATTERNS

Type 1: Building Canadian High/Breezy Winds

- Canadian High building into area (generally 1-2 Days behind a Cold Front)
- Clear Sky in afternoon
- Breezy **Northwester** or North Flow (10-15 mph, G 20-25 mph)
- Cold Air Advection in lowest 5000ft

H

Type 2: Retreating High Pressure and/or Approaching Warm Front/Light Winds

- Canadian High retreating as a Warm Front approaches from the SW
- Clear Sky or thin Mid/High Clouds
- Light Winds generally less than 6 mph
- Deep Mixing Layer

H

SKEW-T ANALYSIS

- With very dry air within the lowest 2km, the inversion should be minimal or non-existent.
- If the Temperature line goes vertical or slopes back to the left, confidence in mixing down drier air to the surface markedly increases.

- Models tend to have too much moisture flux from the surface, resulting in Skew-Ts overestimating Tds in mixing situations.
- Realistic upper bound for surface Td will be mean boundary layer mixing ratio (dash dot line)
- Expected surface Td min with isothermal or inversion at top of BL will be mixing ratio at inversion height. (solid line).
- Minimum bound of Td minimum will be mixing ratio $\frac{1}{4}$ to $\frac{1}{2}$ of the way up the nearly-horizontal Td line (dotted line).

ALL SITES

Frequency of $\leq 40\%/30\%/20\%$ Minimum RH

T/Td/RH Forecasting Best Practices

NWS State College, PA

TEMPERATURE FORECASTING:

- NBM MaxT grids are often 1-2°F higher than the maximum of hourly T grids.
- Copy MaxT grid into 20Z or 21Z grid (based on time of year) and interpolate.
- RH errors from T alone can be a few percentage points

DEWPOINT FORECASTING:

- Identify presence of extremely dry air aloft based on soundings & synoptic patterns.
- Use the SPC Mesoanalysis LCL-LFC Mean RH (thermodynamics tab).

0-3km LAPSE RATE

- As a proxy for identifying days/locations with a weak or non-existent inversion at the top of the boundary layer, use the 0-3km lapse rate. Values of $7.5^\circ\text{C}/\text{km}$ or higher seem to work pretty well.
- File \rightarrow Procedures \rightarrow Open... \rightarrow SITE \rightarrow OfficeLevel.xml \rightarrow Td Bombs / 0-3km Lapse Rates
 - NAM12, SREF, HRRR, & RAP13
- <https://www.spc.noaa.gov/exper/mesoanalysis/new/viewsector.php?sector=16#> \rightarrow Thermodynamics \rightarrow Low-Level Lapse Rates (use Trends/Forecast for RAP guidance)

D2D Tools

- Plan view of dewpoint at sfc, 1km, 1.5km, & 2km
- Open Procedures \rightarrow SITE \rightarrow OfficeLevel.xml \rightarrow Fire Wx / Td Bombs / [Model] Td+MixHgt
 - NAM12, SREF, HRRR, & RAP13
- Identify location of dry air aloft & target potential for highly-localized Td bombs.
- Use in tandem with 0-3km lapse rates \rightarrow collocation increases potential for Td bombs.

GFE TOOLS

MixedDewPoint

- Calculates dewpoint from a selected model (NAM/GFS/RAP) sounding based on the Mixing Height (MixHgt grid) values.
- Make sure to run ChooseProcedures_FireWx_NBM before populating.
- Can blend with other models by publishing output from one model and then blending Official with Forecast.

NBM 10th Percentile Dewpoint

- Can blend in the medium/long range to shade Tds lower.
- To view: WeatherElement \rightarrow WeatherElementBrowser... \rightarrow Source \rightarrow NBM10Pct
- **NBM10Pct** is also included in **ModelBlend_ESTF** tool.

Messaging Fire Weather Days

- ▶ Worked with PA Fire Agencies to identify best practices:
 - ▶ Use “wildfire” in place of “brush fire”
 - ▶ Don’t use “Fire Danger”
 - ▶ Be sure to include “spread” after the phrase “increased risk of wildfire”
- ▶ Designed social media templates to message days with an elevated risk of wildfire spread → 99% of wildfires in PA are caused by humans!
