BACKGROUND

Evaluate the impact of AIRS data on the Rapid Refresh (RAP) and High Resolution Rapid Refresh (HRRR) mesoscale prediction systems, examine ways to maximize forecast improvement

Atmospheric Infrared Sounder (AIRS) data provide high-resolution temperature and water vapor information

Single Field of View (SFOV) profiles (temperature, moisture for clear sky conditions) obtained from application of CIMSS hyperspectral IR sounder retrieval (CHISR) algorithm

AIRS BT

AIRS brightness temperature for channel 791

SFOV T

2100 UTC 8 May 2010

AIRS SFOV temperature for 500 hPA

RAP and HRRR

- Hourly updated assimilation / model system replacing RUC
- RAP uses GSI analysis and WRF ARW model
- Implement at NCEP May 2012
- 13km domain covers all of North America, large oceanic region (few conventional obs.)
- HRRR 3km domain covers CONUS, initialized from RAP

HRRR

Rapid Refresh

- Evaluate impact of AIRS SFOV and radiance data within full mix of observations

1-hr fcst → 1-hr fcst → 1-hr fcst
Background Fields
Analysis Fields

Data types – counts/hr

Data type	counts/hr
Rawinsonde (12h)	150
NOAA profilers	35
VAD winds	~130
PBL profilers / RASS	~25
Aircraft (V,T)	3500–10,000
TAMDAR	200 – 3000
METAR surface	2000 -2500
Mesonet (T,Td)	~8000
Mesonet (V)	~4000
Buoy / ship	200-400
GOES cloud winds	4000-8000
METAR cloud/vis/wx	~1800
GOES cloud-top P,T	10 km res.
satellite radiance	AMSUA/MHS/HIRS
Radar reflectivity	1 km res.
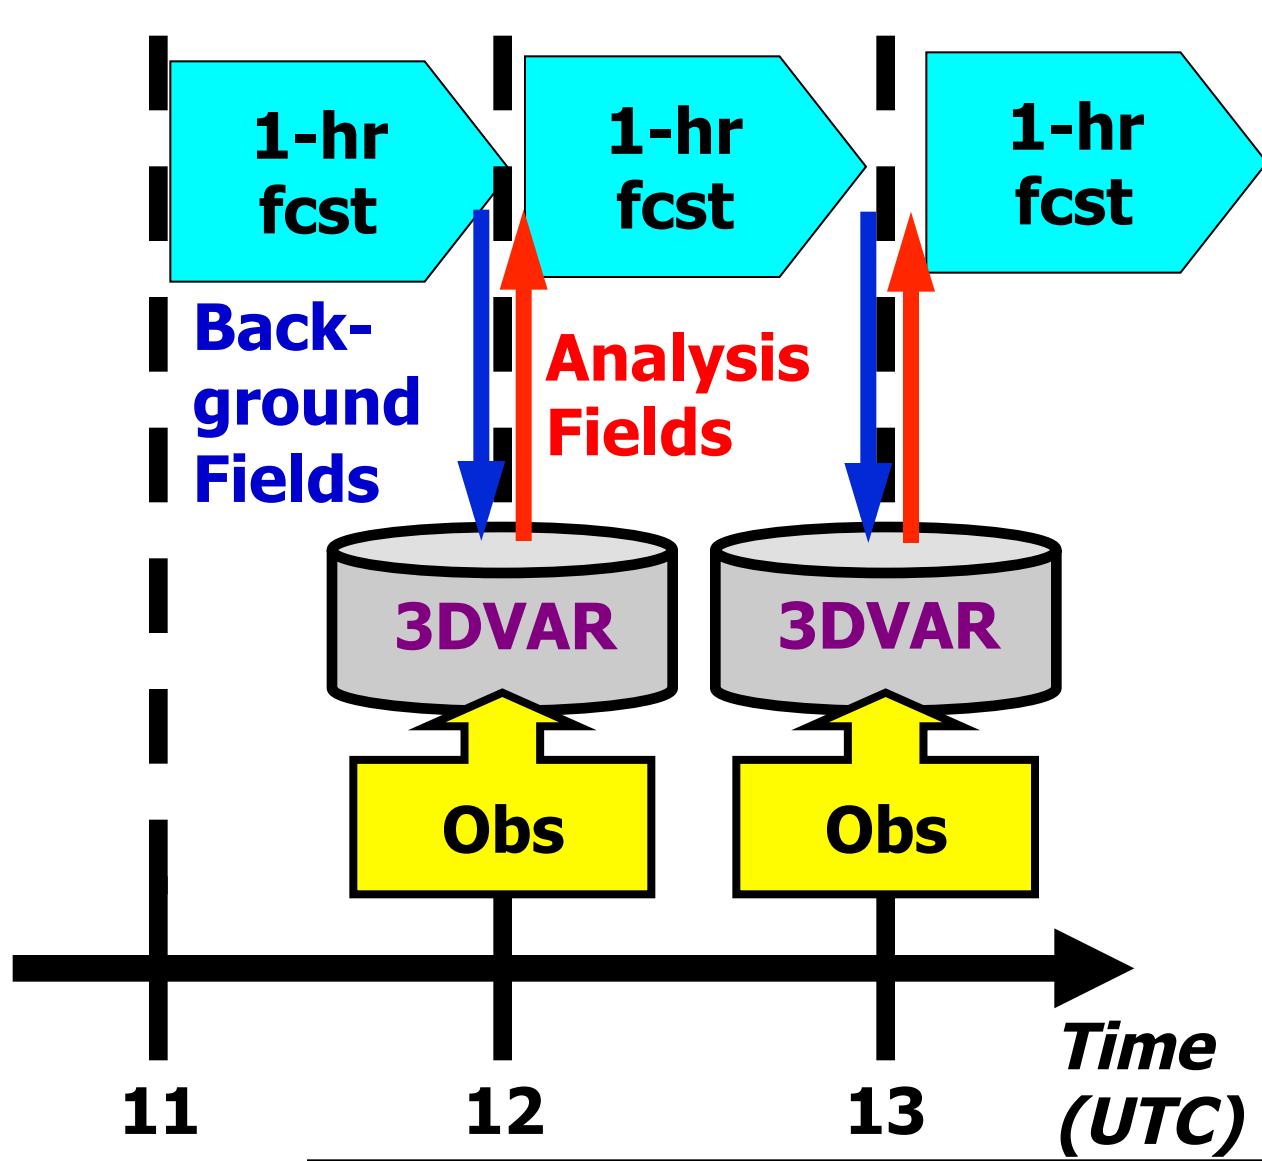

Experiment Design

- 9-day retrospective period (May 8-16, 2010)
- 3-h fully-cycled runs (real-time RAP uses 1-h with partial cycle)
- Raob denial experiment yields results that closely match those in previous RUC raob denial study
- Evaluate impact of AIRS data relative to control experiment with only standard observations
- Evaluate different SFOV DA strategies (data thinning, quality control, bias correction)

SFOV – raob comparison

- 53 matched profiles (clear sky, 15-km horizontal distance, 3-h time window)
- Three SFOV observation sets provided by U. Wisc. CIMSS, improvement shown

V1 – first set
V2 – improved
V3 – best set

Temperature bias
Moisture bias

Mean Temperature Difference (K)
Water Vapor Difference (g/kg)

SFOV Moisture Bias Correction (BC)

SFOV moisture innovation before and after BC

Moisture innovations No bias correction
Moisture innovations +15% bias correction

O-B (%) Dry / Moist
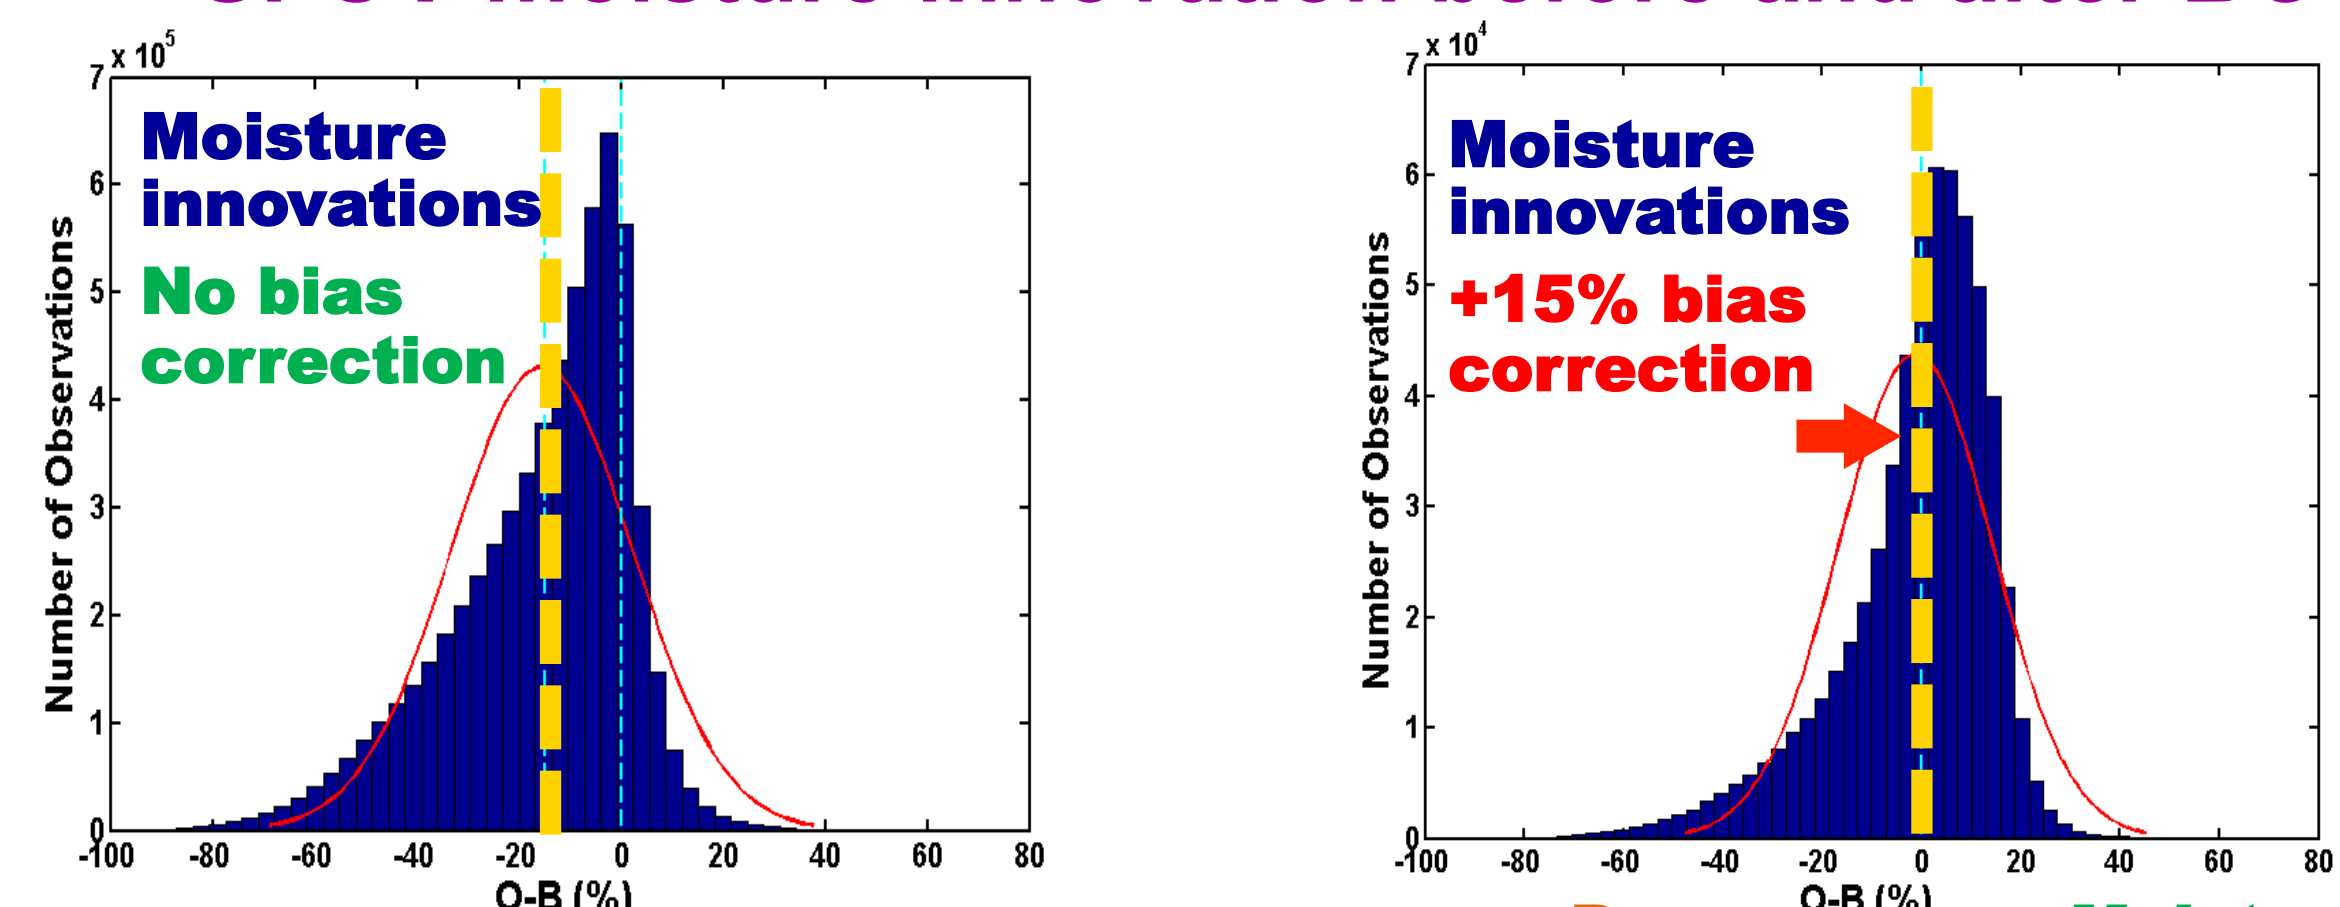

Histogram of moisture innovations [specific humidity (O-B) normalized by background saturation specific humidity] for the data in 400-800 hPa before and after BC from 9-day control run with SFOV in monitoring mode

Analysis **12-h forecast**
SFOV NO BC SFOV WITH BC CNTL
9-day retro average
0-h analysis and 12-h forecast relative humidity bias for control run (no SFOV, black), SFOV with NO bias correction (blue) and SFOV with bias correction (red)
SFOV Temperature Bias Correction

SUMMARY AND FUTURE WORK

Results: AIRS SFOV and radiance data with bias correction produce small positive impact for short-term predictions in the Rapid Refresh assimilating the full mix of observations. Dry bias in SFOV moisture, diurnal bias pattern in Temperature indentified and corrected. Challenges in radiance BC for regional models due to limited coverage and low model top.
Plans: Examine AIRS impact for hurricane and other cases; cloud contamination investigation for radiance data; work toward use of AIRS data in operational RAP
