INTRODUCTION
The Inter-Tropical Convergence Zone (ITCZ) is a zonal belt of intense convection, thunderstorms, which is responsible for the genesis of over 80% of all tropical cyclones (Gray, 1978). A fundamental issue is to understand the necessary precursor events leading to the breakdown of the ITCZ and subsequent formation of tropical cyclones.

OBJECTIVES
1. Develop a dynamical model to solve the non-linear shallow-water equations (SWEs) on an f-plane in MATLAB.
2. Examine the breakdown of finite and infinite PV fields representing the ITCZ.
3. Study the effects of embedded regions of higher PV and mass sinks (simulating convection) on ITCZ breakdown.

THE MODEL
All the numerical integrations described here were performed with the f-plane SWEs

\[
\frac{\partial u}{\partial t} + \left( f + \frac{\partial v}{\partial x} \right) u + \frac{\partial}{\partial z} \left( gh + \frac{1}{2} (u^2 + v^2) \right) = \kappa P^2 u (1)
\]

\[
\frac{\partial v}{\partial t} + \left( f + \frac{\partial u}{\partial x} \right) v + \frac{\partial}{\partial z} \left( gh + \frac{1}{2} (u^2 + v^2) \right) = \kappa P^2 v (2)
\]

where \( u \) and \( v \) are the zonal and meridional components of the velocity, \( f \) is the Coriolis parameter, \( gh \) is the gravitational potential energy, \( \kappa \) is the eddy diffusivity, and \( P \) is the pressure. The domain was a 6400 km \( \times \) 6400 km doubly periodic domain with 512 \( \times \) 512 grid points.

THE EVOLUTION OF PV FROM THE 6 CASES

Images from NASA's GOES East Full Disk Scan showing the breakdown of the ITCZ

The ITCZ in the Eastern-Pacific has a unique shape. Case 5 aims at studying the reoccurring ITCZ pattern unique of the eastern Pacific region.

To simulate regions of enhanced convection, 10 uniform (Case 2) and randomly (case 3) spaced regions of higher vorticity was added to the initial condition. In case 4, ten uniform linearly-spaced mass sinks were added. In the real atmosphere, convection results in diabatic heating. In the shallow water framework this is analogous to shallow fluid depth.

Ertel's PV

Shallow water PV

\[
PV = \rho \left( \frac{\zeta + f}{h} \right)
\]

\[
PV = \frac{\zeta + f}{h}
\]

\( \rho \) is the density of the fluid, \( \zeta \) is the potential temperature and \( z \) is the distance between the \( \theta \) surfaces.

REFERENCES

THEORETICAL EXAMINATION

SOLVING TECHNIQUE

A normal-mode, spectral model was develop in Mathworks MATLAB to solve Eqs. 1-3. Time integration was performed using the 4th order Adams-Bashforth-Moulton predictor-corrector method.

RESULTS

1. Broadband perturbations and mass sinks accelerate the breakdown of infinite strips.
2. Pockets of PV along the center of the strip have a negligible effect on the breakdown of infinite strips.
3. The lopsided PV shape (Case 5) is suggestive of the breakdown of the ITCZ and formation of TGs observed in the Eastern-Pacific.

In case 4, convection was simulated by using a mass sinks that gradually turned on, kept at a constant rate and later turned off. At its peak value, fluid was drained at the rate of 0.017 ms\(^{-1}\) to simulate heating of 10 K per day.

Visualizing a pocket of vorticity in Case 2 and 3 of this section. (a) A sketch of the vortex pocket. Two concentric cylinders of radii \( r_1 \) and \( r_2 \) and, the Hermite Polynomial smoothly reducing the value of vorticity over a radial distance from \( r_1 \) to \( r_2 \) (b) A 3D plot of the pocket of vorticity.

RESEARCH POTENTIAL, COMMENTS AND FUTURE WORK

The SWEs can help us better understand the fundamental dynamics of processes such as the breakdown of the ITCZ and hurricane eye wall evolution. One of the objectives of this project was to develop a numerical model in a new generation user-friendly programing language that can be used for both education and research. The Fast Fourier Transform and matrix manipulation methods in MATLAB made this an ideal choice for this research project and future research work. Please contact the author if you are interested in obtaining a copy of the MATLAB scripts used for this project.
