M. Köhler (ECMWF)

Y. Zhang (NASA GISS)

23rd AMS Conference on Hydrology

Phoenix, AZ, Jan 12-15, 2009

Themes

- **Evaluating reanalyses**
 - **against independent data**
- Annual cycle, diurnal cycle, daily mean
- *Temperature and humidity*
- *Precipitation and evaporation*
- *SW Cloud radiative impacts*
- *Betts, A. K., M. Köhler and Y-C. Zhang, 2008: Comparison of river basin hydrometeorology in ERA-Interim and ERA-40 with observations. J. Geophys. Res. In press. [ECMWF [tm568.pdf](#)]*

River basin archive

ERA-40 and ERA-Interim

Mackenzie

Mississippi

Amazon

Evaluation on river basin scale, starting from **hourly archive**

Amazon: ERA-40 & ERA-Int

Annual T, RH and LCL

- ERA-Interim has
 - larger cold bias
 - high bias of RH and low bias of cloud-base

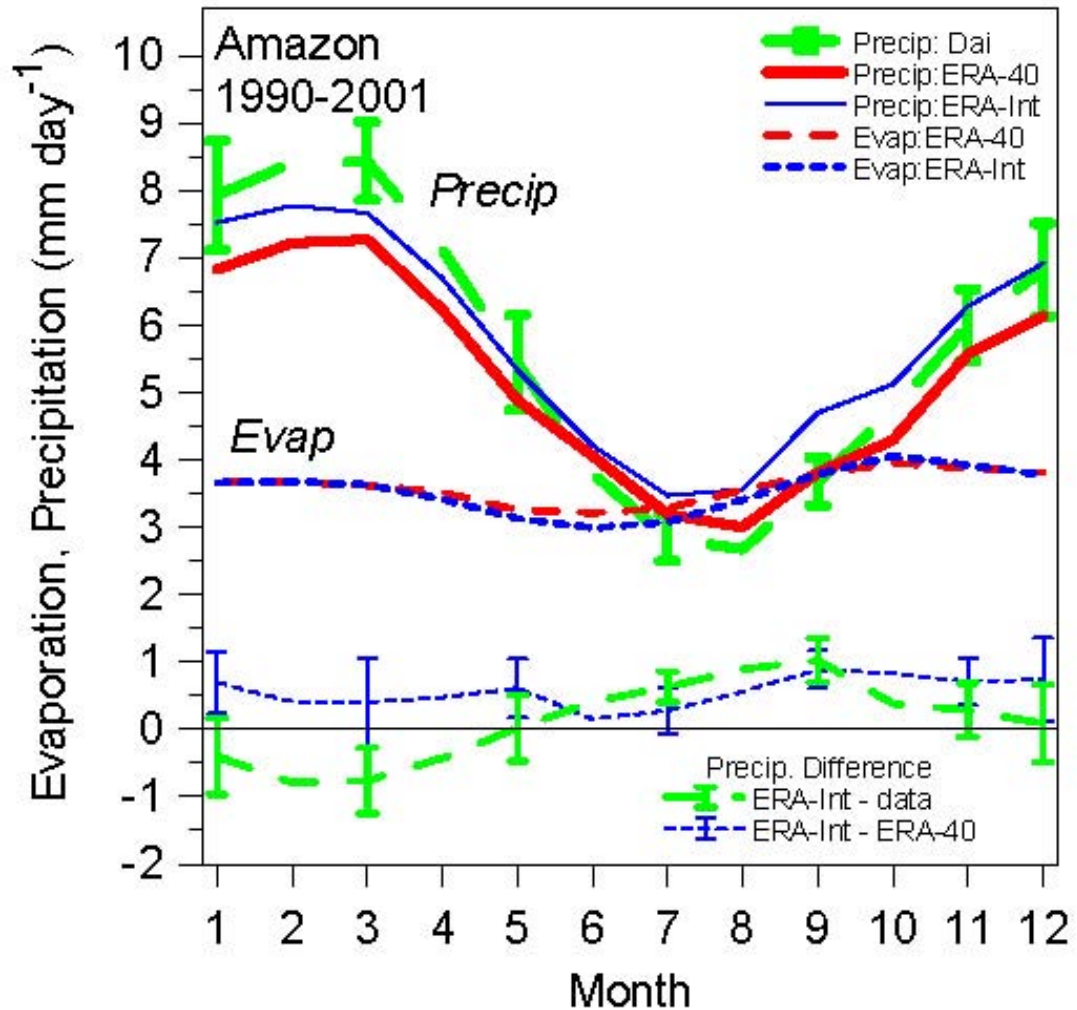

Amazon

Precipitation & Evaporation

Data

ERA-Int

ERA-40

- ERA-Interim precipitation increased
- Seasonal amplitude remains too small

Annual biases

Precip
Temp

- Interannual drift of precipitation reduced
 - annual precipitation largely unbiased
 - from improved humidity analysis [Uppala et al., 2008]
- Cold temperature bias increased substantially

Clouds & Surface SW_{net}

$$SW_{\text{net}} = SW_{\text{down}} - SW_{\text{up}} = (1 - \alpha_{\text{surf}})(1 - \alpha_{\text{cloud}}) SW_{\text{down}}(\text{clear})$$

- *surface albedo*

$$\alpha_{\text{surf}} = SW_{\text{up}} / SW_{\text{down}}$$

- *effective cloud albedo*

- scaled surface **short-wave cloud forcing, SWCF**

$$SWCF = SW_{\text{down}} - SW_{\text{down}}(\text{clear})$$

$$\alpha_{\text{cloud}} = - SWCF / SW_{\text{down}}(\text{clear})$$

“Cloud albedo”: *ERA-40 data*

- Transformation: $\alpha_{\text{cloud}} = \text{SWCF} / \text{SW}_{\text{down}}(\text{clear})$
- Seasonal cycle OK: small daily variability: **Is it biased?**

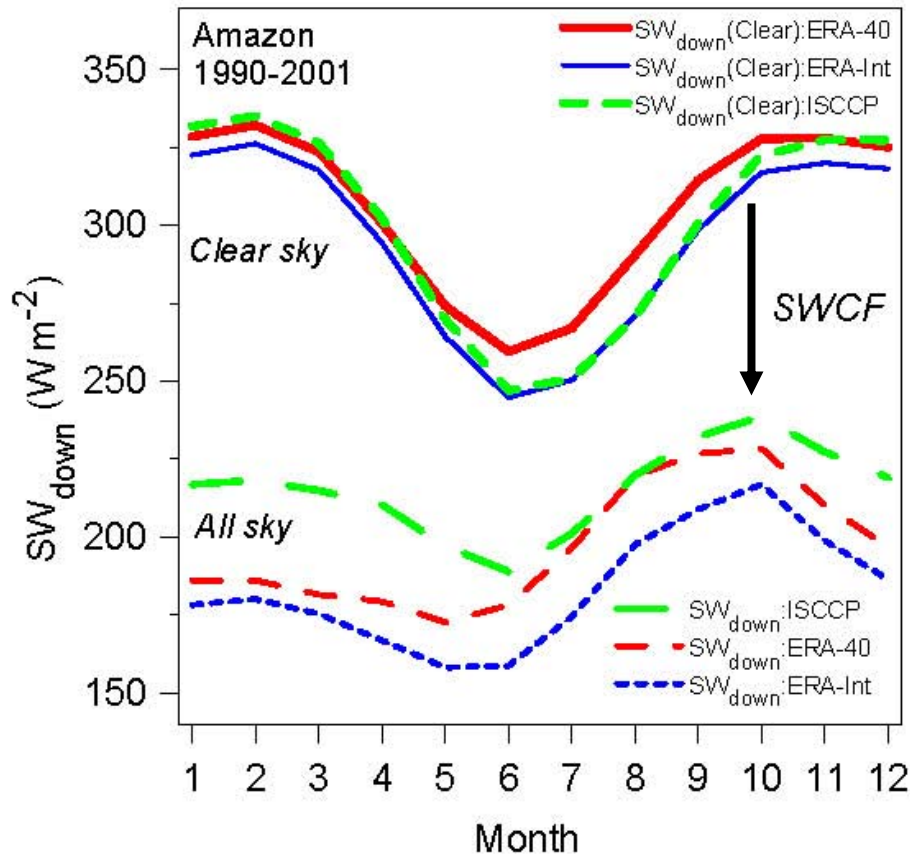

Cloud albedo: *ISCCP* data

- Different clear-sky flux: **Aerosol differences**
- ERA-40 systematic high bias in $\alpha_{cloud} \approx +7\%$
- **ISCCP** has more daily variability

Amazon – *Shortwave & α_{cloud}*

SW_{down}

Clear-sky differences

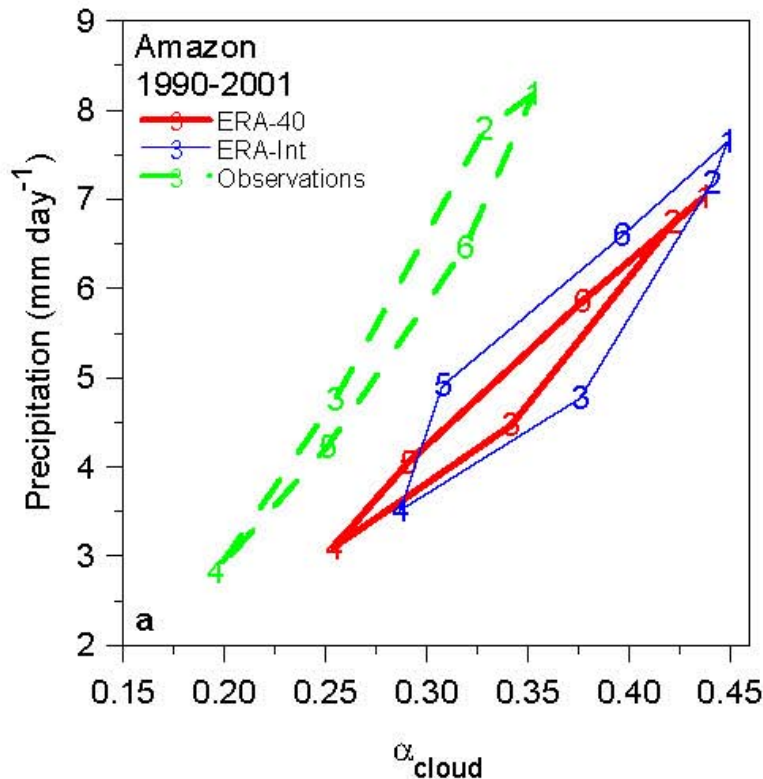

All-sky differences are larger

Cloud albedo

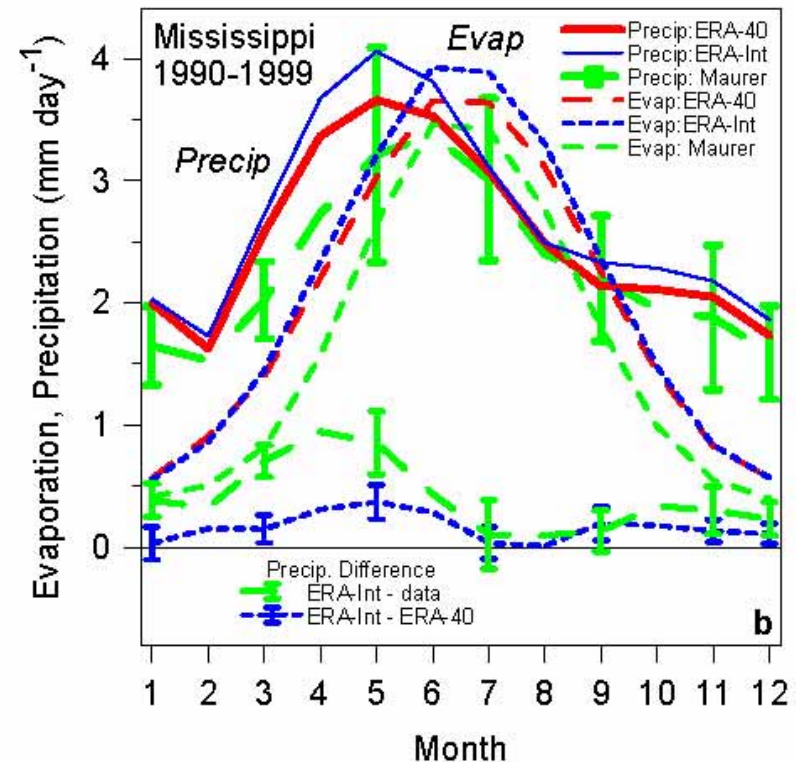

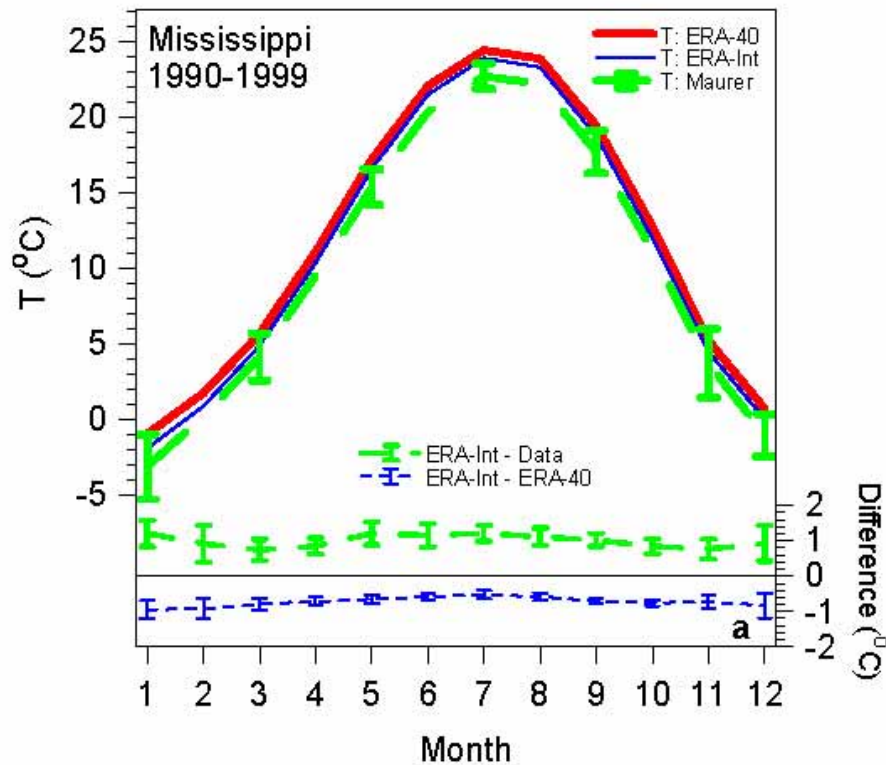

ERA-Int > ERA-40 > ISCCP

Cloud differences

- More cloud in reanalyses for same precip.
- Much more low cloud in ERA-Interim

Mississippi: T , $Precip$ & $Evap$

- ERA-Int a little cooler: still warm bias
- ERA-Int more precip. & evap: larger wet bias

Mississippi – *Shortwave & α_{cloud}*

SW_{down}

Cloud albedo

ERA-Int Clear-sky closer to ISCCP

ERA-Int closer to ISCCP

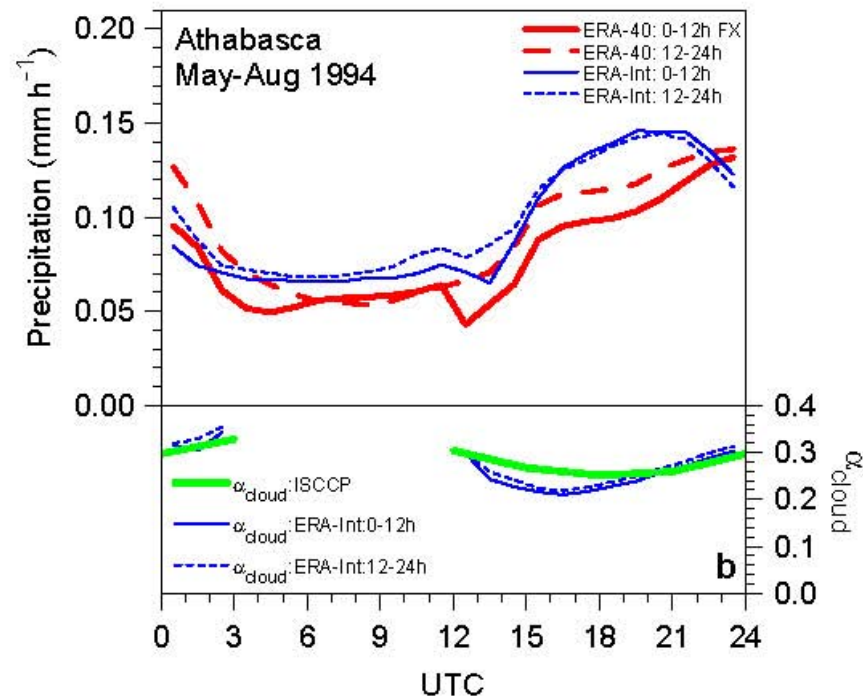

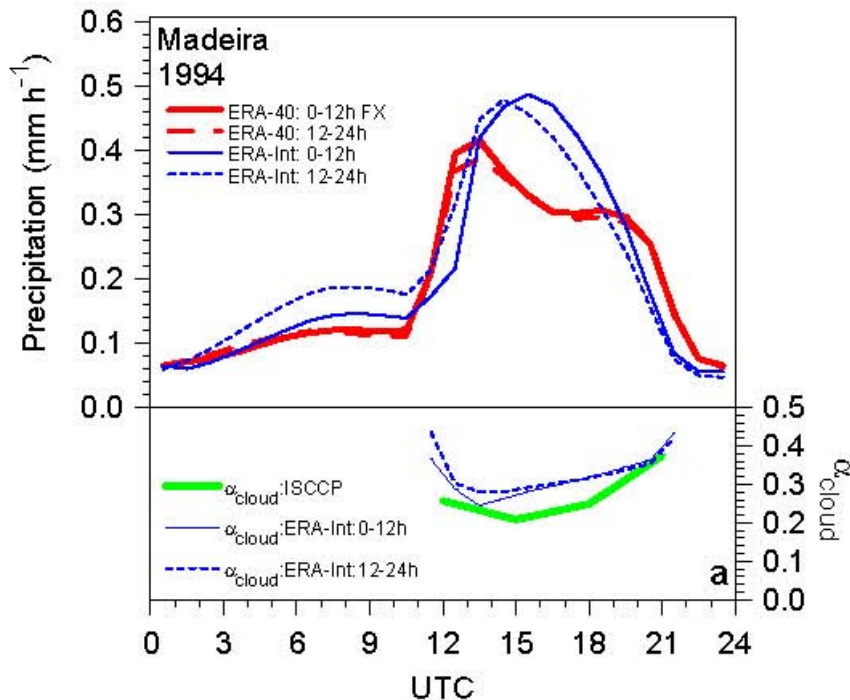

All-sky differences are small

Tropics vs. mid-latitudes

- Amazon: reanalyses α_{cloud} biased high
- Mississippi: different bias signature

Diurnal cycle: reanalyses

- ERA-Int has lost spurious early morning tropical peak, but precip. still too early
- ERA-Int has near-noon peak at all latitudes

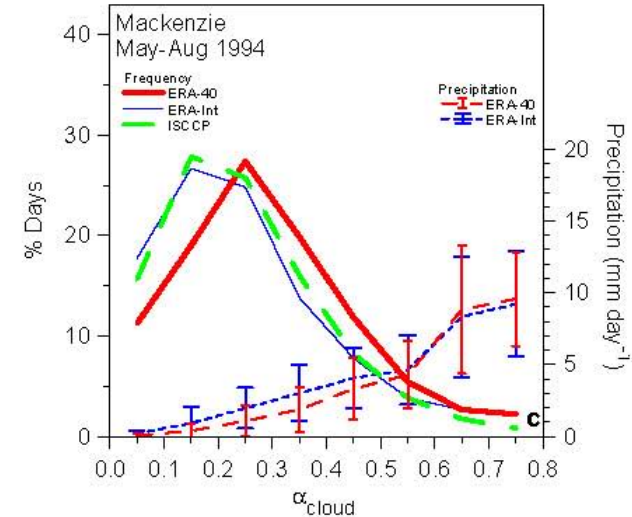

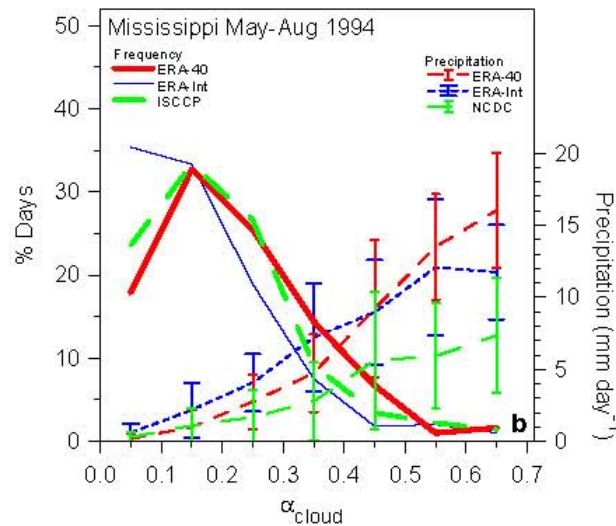

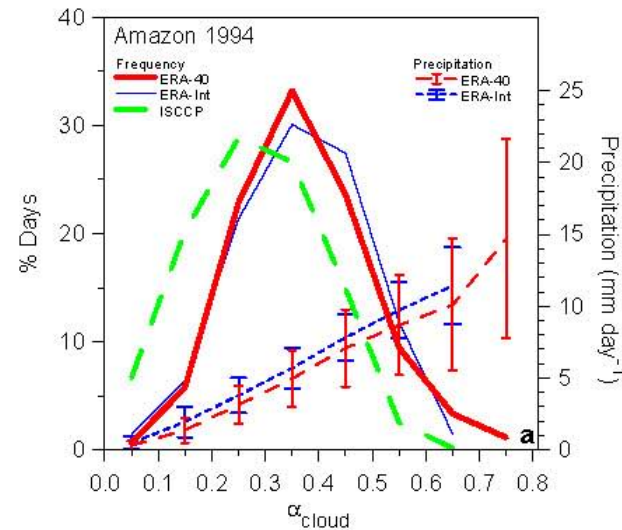

α_{cloud} distribution

- coupling to precipitation

Amazon

Mississippi

Mackenzie

Shift to more cloud

Summer shift to less cloud

- Increase in ratio precip. forcing/cloud forcing in ERA-Int
- tropics too low mid-lats too high

Conclusions

- **Tropics**

- Amazon: interannual drift of precipitation reduced In ERA-Interim
- Annual precipitation improved: seasonal amplitude of precipitation remains too small.
- ERA-Interim has increased low cloud and large cold 2-m temperature bias [Positive bias in SWCF is worse]
- Diurnal cycle of precipitation better, but still rains too early in day

- **Mississippi (& Mackenzie)**

- Temperature biases are small in both reanalyses
- Summer precipitation and evaporation too high
- ERA-Interim has less reflective cloud cover in summer and more in winter – an improvement
- Spinup of precipitation in 24h forecasts greatly reduced in ERA-Int

- *[More recent model cycles have improved Amazon seasonal precipitation, and cloud cover]*

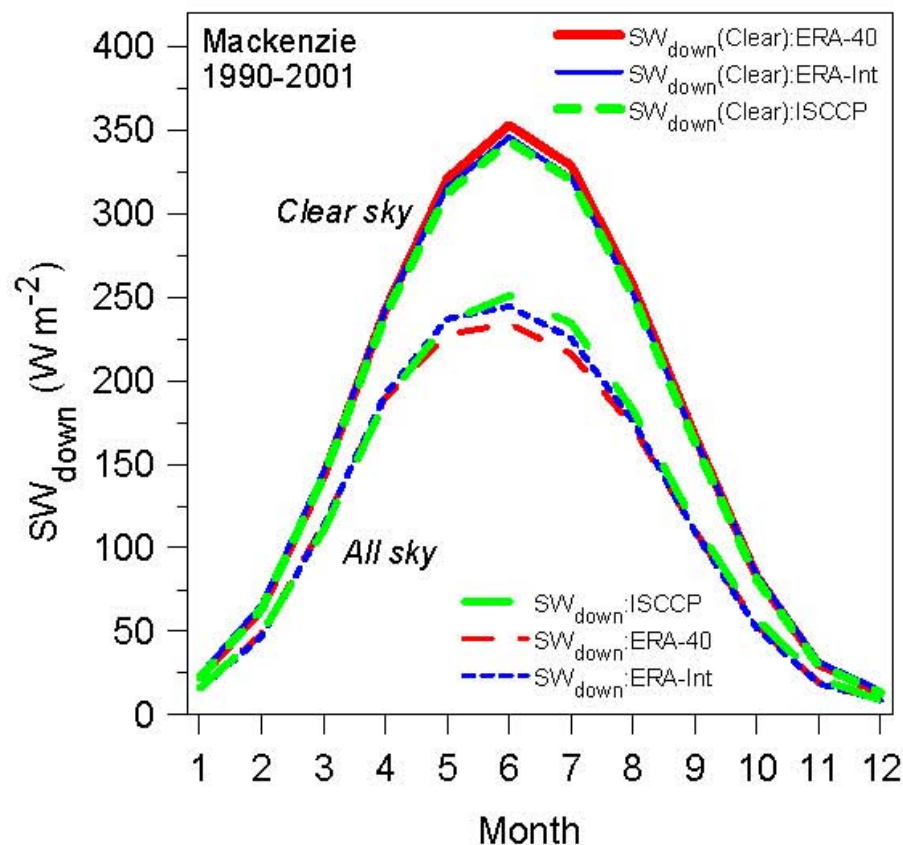

Mackenzie: T , $Precip$ & $Evap$

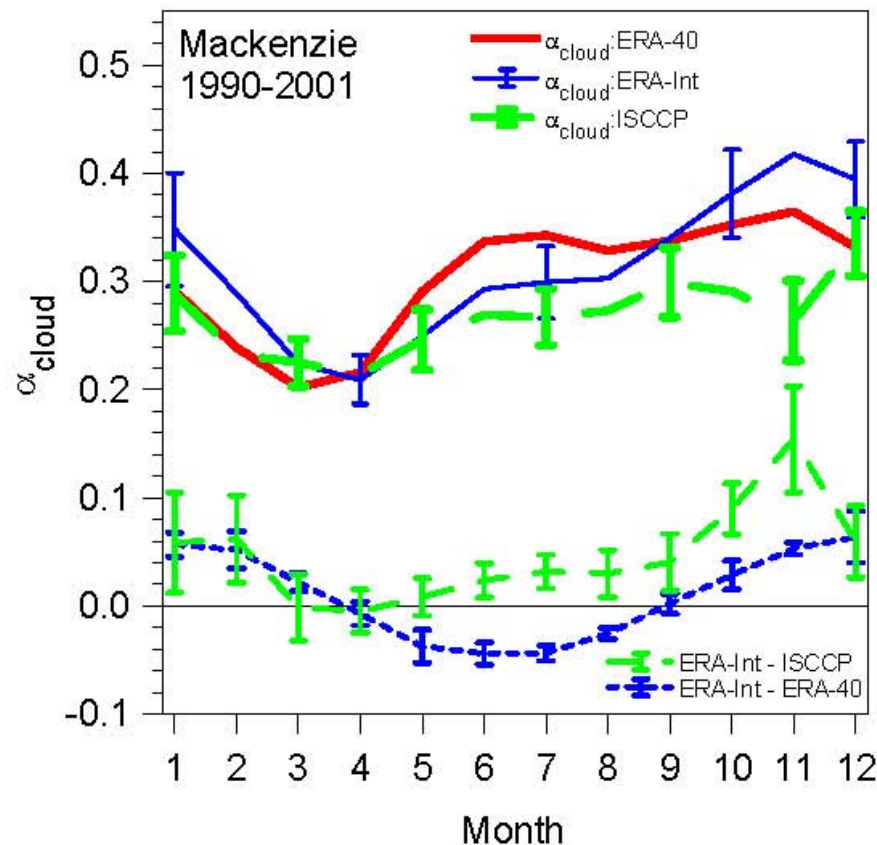

- ERA-Int a little cooler: still warm bias in winter
- ERA-Int more precip. & evap: larger wet bias

Mackenzie – Shortwave & α_{cloud}

SW_{down}

Cloud Albedo

ERA-Int Clear-sky closer to ISCCP

ERA-Int closer to ISCCP in summer

All-sky differences are small
