

URBAN DESIGN AND THERMAL COMFORT:

**ASSESSMENT OF OPEN SPACES IN BARRA FUNDA, A BROWNFIELD SITE IN
SÃO PAULO, BY MEANS OF SITE MEASUREMENTS AND PREDICTIVE SIMULATIONS**

Denise Duarte, Joana Goncalves, Leonardo M. Monteiro
University of Sao Paulo, Sao Paulo, Brazil

Introduction

Object

thermal comfort conditions in different microclimates influenced by the urban design of Barra Funda, a neighborhood in the west side of the city of Sao Paulo.

Objective

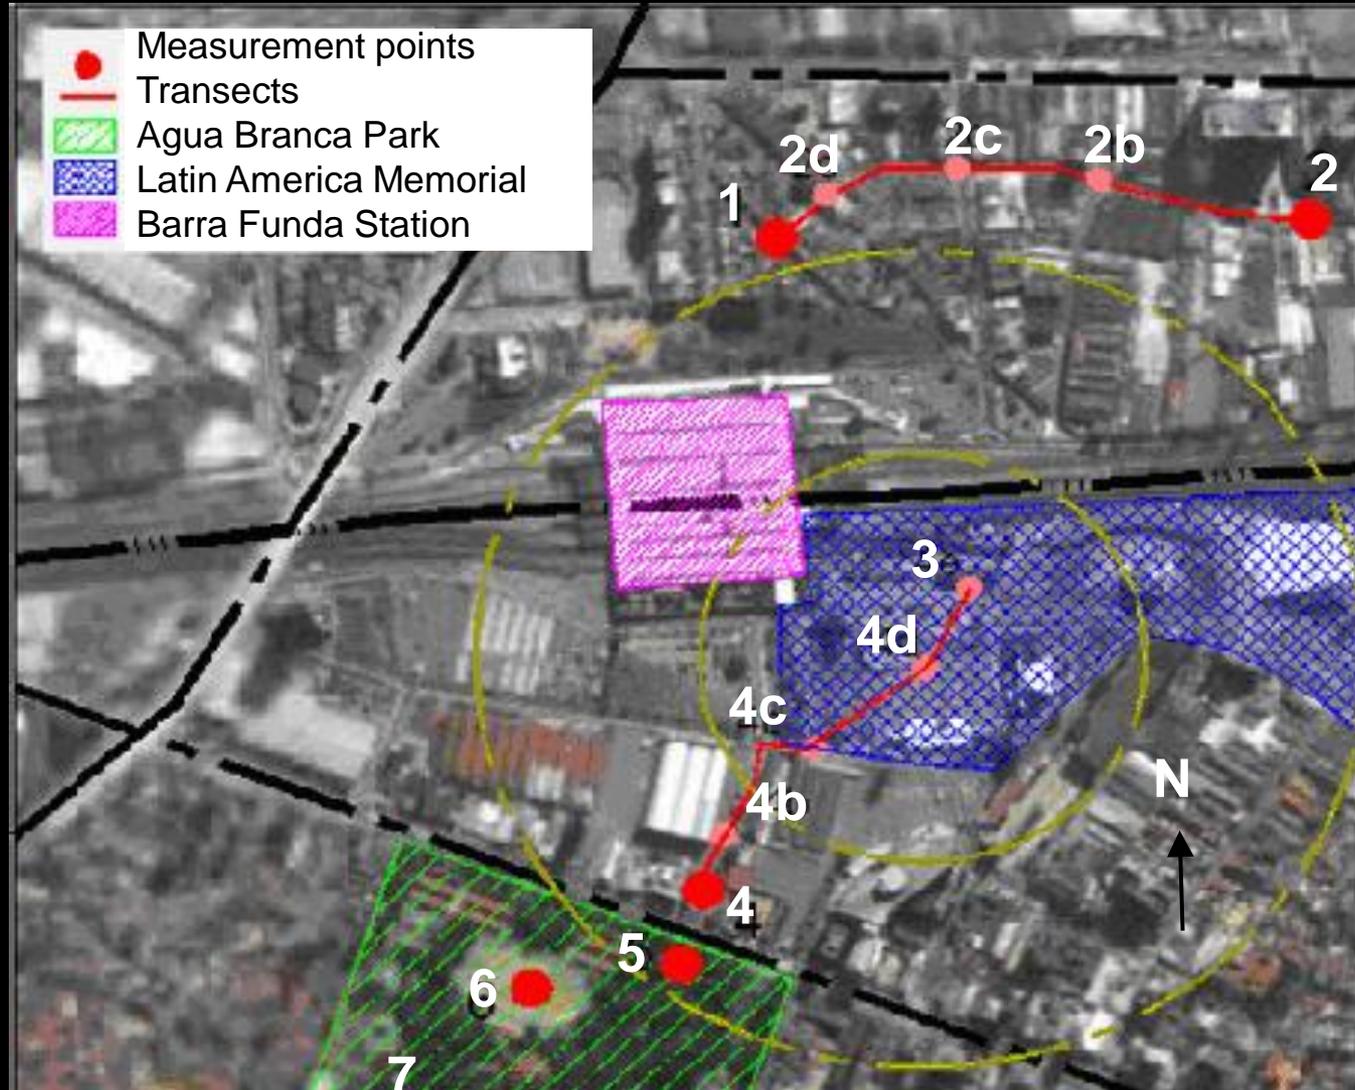

verify the adequacy of different configurations of urban outdoor spaces in Barra Funda, inferring possible correlations between thermal sensations and morphological characteristics, including vegetation, of each outdoor space studied.

Method

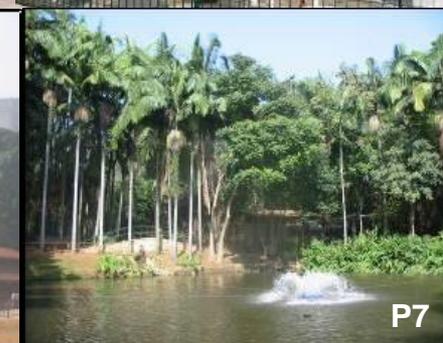

Empirical: microclimatic field measurements

Analytical: simulation of calibrated predictive model

Site of study and points of measurements

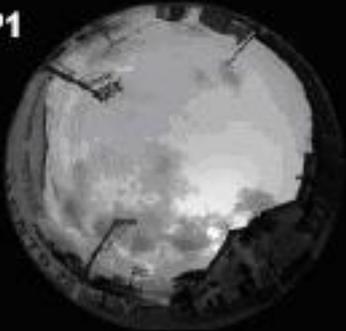

Spots of measurements and transects

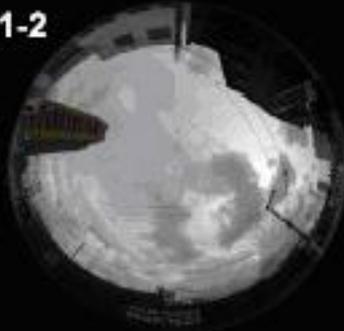

Sky view factor e nebulosity conditions

Methods for estimating thermal comfort conditions

Thero physiological balance

$$S = M - W + L + R_c + C + E_{sk} + R_{es}$$

Mean radiant temperature

$$T_{rm} = [(R_c + 0,5 L_c + 0,5 L_p) / (0,95 \cdot 5,667 \cdot 10^{-8})]^{0,25} - 273$$

$$L_c = 5,5 \cdot 10^{-8} (273 + t)^4 [0,82 - 0,25 \cdot 10^{(-0,094 \cdot 0,75 v_p)}]$$

$$L_p = 5,5 \cdot 10^{-8} (273 + T_p)^4$$

Skin superficial temperature

$$T_s = (26,4 + 0,02138 T_{rm} + 0,2095 t - 0,0185 u_r - 0,009 v) + 0,6 (I_{cl} - 1) + 0,00128 M$$

Heat Load Index

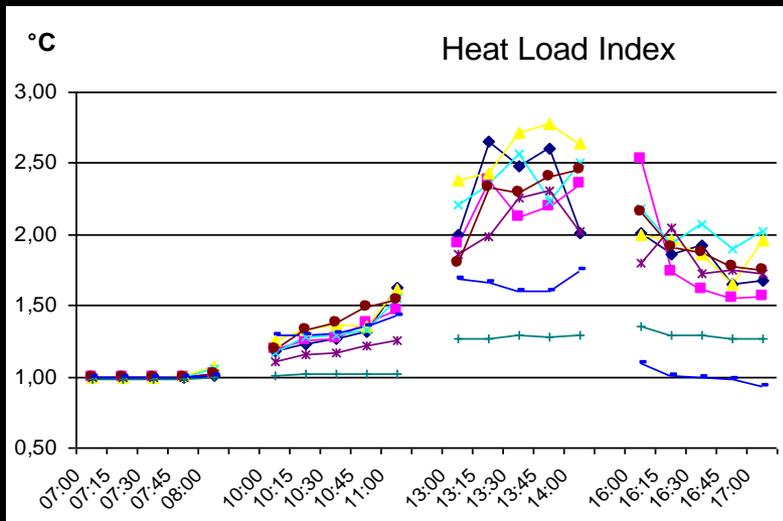

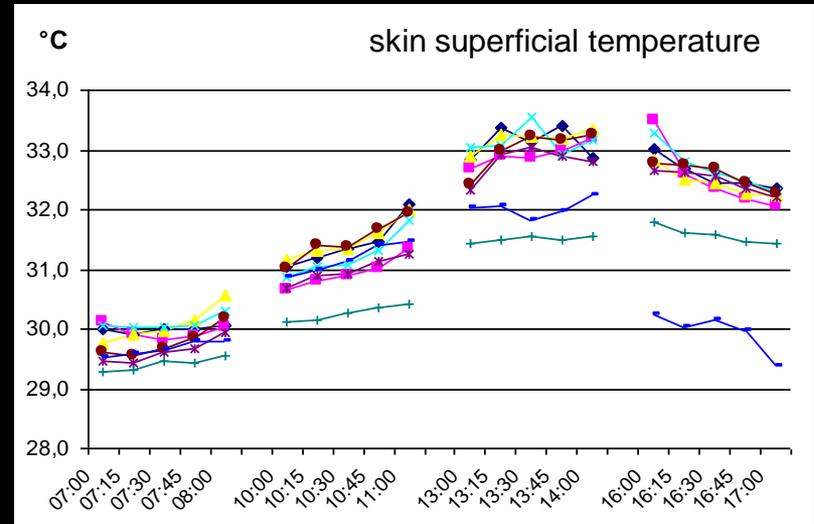

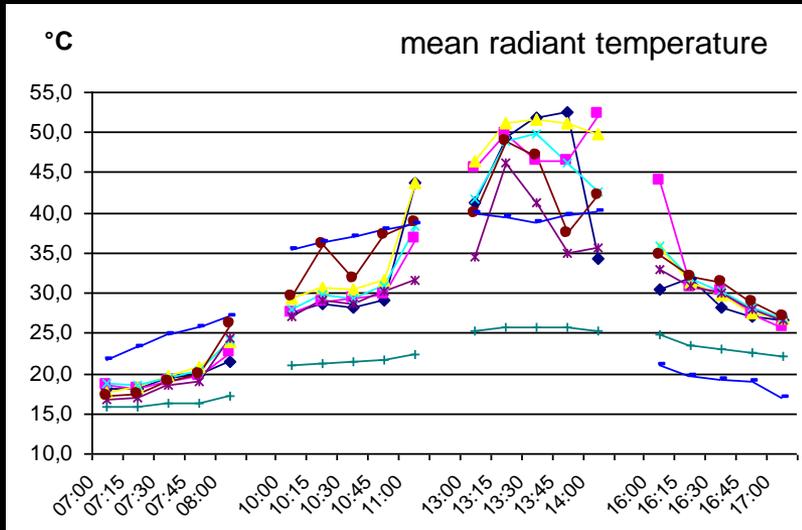

$$S \leq 0 \text{ W/m}^2 \text{ and } E_{sk} \geq -50 \text{ W/m}^2 \quad HL = [(S + 360) / 360] [2 - 1/(1+R_c)]$$

$$S > 0 \text{ W/m}^2 \text{ and } E_{sk} \geq -50 \text{ W/m}^2 \quad HL = [(S + 360) / 360] [2 + 1/(1+R_c)]$$

$$S \leq 0 \text{ W/m}^2 \text{ and } E_{sk} < -50 \text{ W/m}^2 \quad HL = (E_{sk}/-50) \cdot [(S + 360) / 360] [2 - 1/(1+R_c)]$$

$$S > 0 \text{ W/m}^2 \text{ and } E_{sk} < -50 \text{ W/m}^2 \quad HL = (E_{sk}/-50) \cdot [(S + 360) / 360] [2 + 1/(1+R_c)]$$

Estimated data

- ◆ P1: Low rising buildings street
- P2: Fórum Square
- ▲ P3: Latin America Latina Memorial
- ✦ P4: Francisco Matarazzo Avenue
- ✱ P5: Agua Funda Park – Gate
- P6: Agua Funda Park – Arena
- + P7: Agua Funda Park – Trees
- Meteorological Station (FSP)

Predictive model and calibration adopted

HL	Classification	Calibration	Sensation
		$\geq 1,65$	very hot
$\geq 1,600$	high stress (hot)	1,23 - 1,65	hot
1,186 - 1,600	stress (hot)	1,08 - 1,23	warm
0,931 - 1,185	neutrality	0,88 - 1,08	neutral
0,811 - 0,930	stress (cold)	0,72 - 0,88	cool
$\leq 0,810$	high stress (cold)	0,65 - 0,72	cold
		$\leq 0,65$	very cold

HL (Blazejczyk, 2002) and proposed calibration by Monteiro and Alucci (2007)

Final Considerations

- Relationships between different morphologies and vegetation and their influence in the microclimatic conditions
- Consideration of urban design in order to provide proper thermal situations in outdoor spaces

Further research works:

1) Analysis of thermal adequacy:

verification of the results of the original and calibrated indexes;
analysis in full detail of the influence of radiation and ventilation;
comparative application of adaptive model.

2) Intervention proposes, contributing to:

possible urban design interventions for environmental requalification
and also design for occupation of brownfields and open spaces.

Acknowledgement

- We would like to thank all the graduate students that have helped in the empirical research: Anarrita Buoro, Anderson Nedel, Anna Miana, Antonio Machado, Carolina Leite, Daniel Costola, Erica Umakoshi, José Ramos, Juliano Beraldo, Marcos Yamanaka, Mônica Marcondes, Paula Shinzato, Rafael Brandao and Sabrina Agostini. We are also thankful to Prof. Koen Stemeers of The Martin Centre for Architectural and Urban Studies, University of Cambridge, and to Prof. Susannah Hagan, of University of East London, for the discussion that preceded this research in meetings financed by The British Academy. Finally, we would like to thank the Fundacao de Amparo a Pesquisa do Estado de Sao Paulo for the financial support.
